6. Description of the Proposal

Please describe details of the proposed development or works including any change of use.

If you are applying for Technical Details Consent on a site that has been granted Permission In Principle, please include the relevant details in the description below.

Following the clients' liaisons with several water irrigation, ground maintenance and Borehole specialists the best suited proposal is to install a sunken borehole with alongside a new above ground water storage tank and pump room.

The new installation will serve an irrigation system which will operate with new sprinkler heads that will pop up from the pitch. With modern controls the irrigation system can operate without the need for a groundman's presence allowing the system to operate in cooler hours of the day limiting the volume of water lost to evaporation.

Both the Environment Agency and the British Geographical Society have been consulted on the borehole proposal and it has been confirmed that the proposed site is suitable and that can abstract water without licence for up to 20 m3/d per day without cost. (See attached e-mail copies)

Pump/Control Room
The new pump/control room will be a small external uninhabited building constructed from Glass reinforced Polyester (finished in green to remain in keeping). The building will be circa 2.5 x 2.3 metres in floor space to the height of 2.5 metres.

The room will be located beside the new water storage tank and will cover the borehole as well as contain the relevant controls for the new irrigation system.

Water Storage Tank
The proposed water tank will be a 96,000 cubic litre system capable of meeting the needs of the cricket club to ensure the pitch can be adequately watered even in the driest periods of the year.

The tank will be circa 7.62 metres in diameter and circa 2.3 metres in height. These dimensions are required to ensure the tank can be in the preferred location to reduce any possible impact the new installation could have visually on the pitch. The height has been selected to reduce the total footprint and ensure the required volume is achieved.

The tanks façade will be constructed with steel which will be powder coated in green to reduce the visual impact from any onlooking site.

The size of the tank is governed and has been calculated on several factors:
The water abstraction rate (without cost) is a maximum of 20m3/ph per day. It will take 24 hours to achieve with the predicted flow rate of 0.833m3/ph; however, the daily allowed rate means it will take a minimum 5 days to refill the tank after grass watering usage. In addition, whilst securing the supply to ensure the pavilion never runs out of available water. The new tank must meet the demands of the automated pop-up sprinkler system. It is important to note that if in the event of a drought the abstraction rate is likely to be reduced, this will coincide with the period of its' highest
