4.0 HISTORICAL BACKGROUND

4.1 General

4.1.1 An examination of the past history of a site can often provide valuable information in relation to potential constraints to its development. In this particular instance, our focus has been to establish evidence of any mining or other contaminative use within the site or its immediate environs. To facilitate these investigations, past copies of Ordnance Survey maps were examined. It should be noted that considerable periods elapsed between successive Ordnance Survey map editions and the possibility that mining and other activities took place on the land in the intervening years and were not therefore recorded by the maps, cannot be discounted. In these circumstances, while we have tried to ascertain the complete record of the site history, the possibility that industrial and historical mining activities took place but were undisclosed by our researches, cannot be discounted.

4.2 Historical Background

4.2.1 The Ordnance Survey map records, upon which much of the historical background was inferred, are contained within the Envirocheck Report in Appendix A dating from 1860 to present day Table 6 provides summary information on land-use changes through the various map editions.

Table 6: Summary of History (Ordnance Survey Map Records)

OS Map	The Site	Surrounding Area
1860-64	<ul style="list-style-type: none"> The site was indicated to be vacant, potentially agricultural land. 	<ul style="list-style-type: none"> A road that followed the same route as the modern Victoria Place was recorded immediately south of the site. A railway was recorded approximately 100m to the north of the site. The Rochsolloch Brick Works was recorded approximately 400m to the southwest. Several buildings approximately 200m to the east of the site. A coal pit was recorded approximately 175m to the west of the site. A coal pit was recorded approximately 200m to the south of the site. An 'old' pit was recorded approximately 225m to the south southeast of the site. A coal pit was recorded approximately 425m to the southwest of the site near to the Rochsolloch Brick Works.

Table 6 CONT: Summary of History (Ordnance Survey Map Records)

OS Map	The Site	Surrounding Area
1899	<ul style="list-style-type: none"> No significant changes were recorded on site. 	<ul style="list-style-type: none"> None of the coal pits nor the 'old' pit were recorded. Rochsolloch was recorded as Rochsolloch Farm. An old quarry was recorded approximately 25m to the south of the site. A presumably residential building was recorded approximately 100m to the east of the site. Several residential buildings were constructed approximately 100m to the north of the site. The Rochsolloch Iron and Steel Works were recorded approximately 200m to the southwest. A boiler and girder works were recorded approximately 220m to the west.
1912-14	<ul style="list-style-type: none"> No significant changes were recorded on site. 	<ul style="list-style-type: none"> Rochsolloch school was recorded immediately north of the site. A church and a school were recorded approximately 80m to the west of the site. The Climax Engineering Works were indicated approximately 100m to the southeast of the site. A reservoir was recorded approximately 150m to the south of the site. The Imperial Tube Works were indicated approximately 150m to the southeast of the site. A foundry was recorded approximately 200m to the west of the site. The Rochsolloch Brick Works were no longer indicated to be present.
1938-40	<ul style="list-style-type: none"> No significant changes were recorded on site. 	<ul style="list-style-type: none"> The foundry was no longer recorded.
1956-58	<ul style="list-style-type: none"> Allotment gardens were present in the northernmost part of the site. 	<ul style="list-style-type: none"> A clothing factory was recorded immediately east of the site. An electrical substation was recorded immediately southeast of the site. A TA centre was recorded immediately south of the site. The old quarry was no longer recorded.

Table 6 CONT: Summary of History (Ordnance Survey Map Records)

OS Map	The Site	Surrounding Area
1961-73	<ul style="list-style-type: none"> No significant changes were indicated on site. 	<ul style="list-style-type: none"> A road recorded as Victoria Place ran along the southern site boundary. Works were recorded immediately south of the site. The boiler and girder works were noted as engineering works.
1971-77	<ul style="list-style-type: none"> A telecommunications works and associated carpark was present where the current Teleperformance building is. 	<ul style="list-style-type: none"> A joinery works, depot, tank and light engineering works were recorded immediately northwest of the site. A light engineering works and egg packing station were recorded approximately 50 m to the northwest of the site. The TA centre was shown as a depot. The clothing factory was now indicated to be a textile factory. Rochsolloch Farm was no longer recorded.
1979-93	<ul style="list-style-type: none"> No significant changes were recorded on site. 	<ul style="list-style-type: none"> The light engineering works and egg packing station were no longer recorded. The reservoir was no longer recorded.
1999	<ul style="list-style-type: none"> No significant changes were recorded on site. 	<ul style="list-style-type: none"> The joinery works, tank, depot and light engineering works were now identified as 'works'.
2021	<ul style="list-style-type: none"> No significant changes were recorded on site. 	<ul style="list-style-type: none"> The following were no longer recorded - all depots and 'works', textile factory, Imperial Tube Works and engineering works. Much of these were replaced by residential buildings apart from the area immediately west of the site, which became part of the modern industrial estate.

4.3 Review of Historical Usage in the Context of the Proposals.

- 4.3.1 The site was vacant land within an industrial setting for much of its history, latterly being developed for industrial/commercial usage. Significant made ground deposits could potentially be present on site.
- 4.3.2 Buildings constructed on site have the potential for asbestos to be present, especially associated with cementitious roofing panels.
- 4.3.3 Among the contaminants that can be associated with industrial land are oils and solvents, other organics (e.g. aromatic hydrocarbons, polychlorinated biphenyl), inorganic ions, asbestos and metals. The key considerations with regard to the sites condition and future usage are summarised in Table 7

Table 7: Summary of Key Considerations Suspected from the Historical Background

Consideration	Potential source of Impact
Contamination	Processed fill material associated with construction/demolition activities
	Asbestos roofing sheets associated with former buildings
Gas Emissions	From biodegradable materials in fill material associated with construction
	From underground mine workings
Adverse Foundations	From possible made ground
Buried Structures	Possible

5.0 **Historical Mining**

5.1 **General**

5.1.1 The site is in a Coal Mining Reporting Area and a Development High risk Area. The Coal Authority Report (Appendix C) indicates that underground mining has taken place at the site. Underground mining is indicated in the Virtuewell, Kiltongue and Upper Drumgray seams at depths of between 33m and 80m beneath the surface.

5.1.2 Three mine entries are present on site (275664-001, 275664-002 and 275664-036) indicated by the Coal Authority to be present at grid references 275181 664888, 275087 664816 and 275149 664901 respectively.

5.2 **Mining Methods**

5.2.1 The methods of mining historically adopted in the area were opencast as well as the 'stoop and room' and 'longwall' systems of extraction. The stoop and room mining operations involved partial excavation of the mineral, with the seam recovered from 'rooms' and the roof supported by retained 'stoops' or 'pillars' of mineral. The pillar or stoop widths varied depending on the depth and the condition of the roof, but stoops could range up to around 4.0m square, with roadways often around 2.0m wide.

5.2.2 In the 'longwall' method of mining, extraction was virtually total with the seam face accessed via supported roadways. In the areas from which the seam had already been removed, the roof was generally allowed to collapse behind the face, or was partially supported by spoil or 'waste' deposited within the works. While the workings would be generally closed on abandonment with the withdrawal of roof support, roadways would be expected to remain open and artificially supported long after the operations had ceased. A variation of the longwall method is the technique commonly used in deep mining today but was generally only applied to the recovery of ironstones or coals of restricted thickness in the 19th century.

5.3 **General Principles of Surface Instability**

5.3.1 It is generally accepted that old abandoned mineworkings are susceptible to collapse. This is typically the consequence of on-going deterioration within the mines and failure can occur a considerable time after abandonment. The mechanisms of collapse are varied and complex, but generally involve either a yield in the roof of the mine between supports, or collapse as a direct result of failure of the supports. Except in instances where the mineworkings are very shallow for example, less than 10 m deep, the stability is comparatively unaffected by enhanced loadings from buildings or by vibrations from heavy traffic. Progressive deterioration within the workings can, however, advance to a stage where instability is reached and collapses occur. In most cases, however, it is impossible to predict with any degree of accuracy if, and when, such movements will take place.

5.3.2 Subsidence assessments generally consider various elements of the geological and mining configuration. These include the nature and thickness of the rock and soil overburden, the extracted height of the workings and the typical mine configuration. Assessments typically seek to achieve a rock/overburden cover thickness of 10 times the seam extraction height. This is consistent with a number of recent studies in the field of mining stability assessment.

5.4 **Surface Instability Due to Mining**

5.4.1 Our researches have indicated that the site may be underlain by the Virtuewell, Kiltongue, and Upper Drumgray Coal seams at depths of between 33m and 80m beneath the surface.

5.4.2 Extraction thicknesses in the area are indicated to be up to 114cm in the Kiltongue Coal.

5.5 **Mine Entries**

5.5.1 Three mine entries are present on site (275664-001, 275664-002 and 275664-036) indicated by the Coal Authority to be present at grid references 275181 664888, 275087 664816 and 275149 664901 respectively. Nothing is known about the dimensions of any of the shafts.

5.5.2 As in every area of former mining, the possibility that unrecorded shafts exist undetected cannot be excluded.

5.6 **Potential for Future Mineral Extraction**

5.6.1 We would advise that we have not carried out detailed research of the potential for future resource extraction beneath or within close proximity of the site. While we consider the likelihood of future extraction remote, the mineral ownership should be checked by the client's legal advisors.

6.0 PRELIMINARY CONCEPTUAL SITE MODEL

6.1 General

6.1.2 In order to fully evaluate the potential presence of contamination at the site, the study area must be considered in an environmental context taking account of its geology, topography, past and present land-use. Science Report SC050021/SR3, published by the Environment Agency in January 2009, supersedes the previous Contaminated Land Reports (CLR7 to CLR10 and briefing notes) series and provides standard guidance for the assessment of sites that may be contaminated. This essentially highlights the importance of developing a robust Conceptual Site Model. The model forms an integral part of the contamination assessment of the proposed development site highlighting potential contamination sources and how these may impact on identified receptors. We have carried out the researches with a view to constructing an appropriate model for the site, recognising the intended development.

6.2 Environmental Legal and Planning Setting

6.2.1 Part IIA of the Environmental Protection Act 1990 (inserted by Section 57 of the Environment Act 1995) has created a new regime for the identification and remediation of contaminated land. A revised Statutory Guidance Edition 2 (Paper SE/2006/44) to the Act was published by the Scottish Executive in May 2006. Within the Revised Statutory Guidance Document issued under Section 78A (2), (5) and (6) of the Environmental Protection Act 1990, contaminated land is defined as:

“Any land which appears to the local authority in whose area it is situated to be in such a condition, by reason of substances in, on or under the land, that “*significant harm is being caused or there is significant possibility of such harm being caused*”; or “*significant pollution of the water environment is being caused or there is a significant possibility of such pollution being caused*”.

6.2.2 Part IIA of the Environmental Protection Act 1990 and Planning Advice Note (PAN33) sets the definition of contaminated land within the ‘suitable for use’ approach. This is based on the principles of risk assessment, including the concept of a pollutant linkage between a source contaminant and a receptor, by means of a pathway. For an environmental risk to exist there must be:

- A source of contamination (hazard);
- A pathway via which the hazard can be transmitted; and
- A target or receptor, which has the potential to be exposed to unacceptable levels of contaminant.

6.2.3 The presence of all three elements identifies a plausible pollutant linkage. An assessment of the potential sources, pathways and targets constitutes a conceptual model for the site, as described. Clearly in the absence of any tangible site investigation data, the model can only be conjectured at this stage. However, the researches provide a sound basis for highlighting the key elements of the model.

6.3 Potential Sources of Contamination

On Site Sources

- 6.3.1 The researches have revealed that the site has been used for industrial and mining purposes with a telecommunications works present from at least the 1970's.
- 6.3.2 Based on this former site usage, there is a potential for contaminants associated with former mineral extraction. There is also the potential for significant made ground deposits associated with industrial activity on site. The presence of Asbestos Containing Materials (ACMs) associated with the existing building on site is also considered possible.
- 6.3.3 In summary the principal sources of contamination that could exist on site are the soils, of which any fill deposits would be considered to present the higher risks, asbestos containing materials from the building, impacted groundwater and ground/mine gas.

Off-Site Sources

- 6.3.4 Potential off-site sources of contaminations include the nearby railways as well as the numerous industrial works. Old mines and quarries within the surrounding area may also pose a contamination risk. Other possible sources of contamination are the clothing/textile factory (immediately east of the site), the electrical sub-station (immediately southeast of the site), the works and TA centre (immediately south of the site), the joinery works, tank, depot and light engineering works (immediately northwest), the Climax Engineering Works (approximately 100m southeast), the Imperial Tube Works (approximately 150m southeast), the Rochsolloch Iron and Steel Works (approximately 200m southwest), the foundry (approximately 200m west), the boiler and girder works (approximately 220m west), and the Rochsolloch Brick Works (approximately 400m southwest). These sources have potential to impact on the site through migration of pollutants. Similarly, any biodegradable constituents could be a source of gas emissions. As such, the greatest risk is likely to be through impacted soil and groundwater or landfill/mine gases migrating to the site.

Table 8: Contaminants of Concern

THE SITE	Industrial Activity/ Site Use	Potential Pathways	Associated Potential Contaminants
CURRENT AND PREVIOUS	<ul style="list-style-type: none"> • Deposition of contaminated made ground associated with the former industrial works on site. • Deposition of contaminated made ground associated with the former mine workings on site. • Generation and accumulation of ground gasses from made ground deposits. • Generation and accumulation of mine gasses from underground mine workings 	<ul style="list-style-type: none"> • Deposition of made ground • Generation and accumulation of ground and mine gasses • Leaching of contaminants to groundwater through soakaway infiltration and direct discharge to drains and the ground. • Leakage/spillage of hydrocarbon product • Leakage or spillage of oil and/or fuel 	<p>Metals: As, Cd, Cr, Ni, Zn, Cu, Hg, Pb</p> <p>Organics: Fuel oils, PAH,</p> <p>Miscellaneous: Asbestos, Cyanide, Herbicides, Pesticides</p> <p>Ground/Mine Gasses: CO₂, CH₄</p>
IMMEDIATE SURROUNDING AREA	Industrial Activity/ Site Use	Potential Pathways	Associated Potential Contaminants
CURRENT AND PREVIOUS	<ul style="list-style-type: none"> • Former mines and quarries • Former Rochsolloch Brick Works • Former Rochsolloch Iron and Steel Works • Former Boiler and Girder Works • Former Climax Engineering Works • Former Imperial Tube Works • Former Foundry • Former Clothing/Textile Factory • Former TA Centre • Former Works • Former Joinery Works • Former Depots • Former Light Engineering Works • Electrical Substation. 	<ul style="list-style-type: none"> • Deposition of waste materials • Generation and accumulation of ground/mine gasses • Leaching of contaminants to groundwater • Migration of gases and vapours. • Leakage/spillage of hydrocarbon products 	<p>Leachates (metals, semi-metals and non-metals)</p> <p>Ground Gasses: CO₂, CH₄</p> <p>Fuel oils, PAH, phenol, PCBs.</p>

* It should be noted that the potential contaminants listed above are intended as a guide to the possible contaminant species which may be encountered in such sites, and that other contaminants could potentially be present. The species will, however, be considered in the site assessment and evolution of appropriate chemical testing regime based upon the finding of the investigations and recommendations of the industry profiles will be carried out.

6.4 Receptors and Pathway Characterisation (Pollutant Linkages)

- 6.4.1 Pathways for the migration of contaminants may be both airborne dispersions (gases and dust) and through the soils, largely in groundwater movements. The movements through the soils can be facilitated by groundwater flows, which should be determined, and the connection between different groundwater systems should be assessed. In addition, service trenches, drainage runs, underground storage tanks, former foundations, and other physical features could influence the migration of contamination. As such, these aspects will require to be considered further.
- 6.4.2 The most sensitive receptors and the pathways by which they may be exposed to potential sources of contamination are as follows:
- 6 Human and Ecological Receptors (site end users, visitors and construction operatives)
 - *Dermal (skin) contact with contaminated soil, fugitive dust and the absorption of any contaminants through the skin into the body.*
 - *Inhalation of fugitive soil dust or vapour.*
 - *Ingestion of soil by hand to mouth activity*
 - *Inhalation of any ground gas migrating into the buildings.*
 - 7 Groundwater Receptors (groundwater systems)
 - *Leaching of contaminants from the soil to groundwater.*
 - *Direct leakage/spillage of contaminants dissolved in the groundwater.*
 - *Discharge of fluids or soluble wastes direct to soakaways or drains.*
 - 8 Buildings (Existing and proposed buildings and associated infrastructure)
 - *Contact of building materials with aggressive chemicals or acidic soils.*
 - 9 Public Utilities (domestic water supply, pipes and cables)
 - *Direct contact with contaminated soil or groundwater.*
 - *Leaching of contaminants through the soil.*
 - *Service trenches acting as preferential migration pathways for contamination.*
 - *Permeation of plastic water supply pipes.*
 - 10 Vegetation (plants in landscaping)
 - *Uptake of contaminants from the soil or groundwater into the plant.*
- 6.4.3 On the basis of the above, a qualitative risk assessment is described in Table 9 below and the potential source-pathway-receptor relationships, based on the preliminary qualitative risk assessment, are summarised in Drawing P21/176/DS/R/F/09 - Preliminary Conceptual Site Model (CSM).
- 6.4.4 Under the environmental legislation, site owners can inherit liability for impacts of contamination arising from their site, even where this may not have been the result of activities carried out by them or during the tenure of their ownership. This is a significant consideration in the assessment of contamination within the site. However, the wider environmental interests are also considered, especially where contamination or gas has the potential to impact site users.

6.4.5 The risk evaluations are as outlined. That is, where the risk is estimated to be 'low', we consider that there is sufficient information available to suggest that the indicated source is unlikely to have any material effect on the site and its intended usage. Where a 'moderate' risk is shown, we consider that circumstances could reasonably arise where the site and its users could be impacted by the identified source. In the case of an assigned 'high' risk, we consider that there is sufficient information to indicate that the site will be impacted by the defined source. The Qualitative Risk Assessment has considered the identified potential source-pathway-receptor linkages to be ranging from 'low to moderate' or 'moderate to high' risk. This is based on our opinion on the potential severity of an identified impact, considering the receptor and the development plans. The main aspect of contamination risk can be summarised as arising from the site relates to the soils and groundwater, arising from the previous and possible more recent usage. Offsite contamination migrating cannot be discounted.

6.4.6 In addition to the contamination risks, there is also a possibility of landfill or mine gas generation within the site. Biodegradable sources could be present within fill containing putrescible material. Where gas concentrations accumulate at high levels, issues of potential explosive methane/oxygen mixtures or asphyxiation in other gases must be considered.

Table 9: Preliminary Qualitative Risk Assessment

Source	COCs	Pathway	Receptors (s)	Assessment	Risk
On site: <ul style="list-style-type: none"> Deposition of contaminated made ground associated with the former Industrial Works. Deposition of contaminated made ground associated with the former mine works. Generation and accumulation of ground gasses from made ground deposits. Generation and accumulation of mine gasses from underground mine workings Electrical Sub-Station immediately southeast of the site. 	Al, Mg, As, Cd, Cr, Ni, Zn, Cu, Hg, Pb, Acids, Fuel oils, PAH, Phenol, Asbestos, CO ₂ , CH ₄ , PCBs	Dermal contact, ingestion, inhalation	Humans – end users (outdoor)	Spillage/leakage of contaminants impacting near surface soils.	Moderate
			Humans – end users (indoor)	Contaminated materials may have been deposited within the site.	
		Leaching through soil or direct migration	The water environment – groundwater and surface water	The natural superficial soils beneath the made ground are conjectured to include relatively impermeable glacial till, inhibiting the downward percolation of water, but enhancing lateral groundwater movements in perched systems above the till.	Moderate
		Gas/vapour inhalation, vertical/lateral migration	Humans – end users (indoor)	Possible gas/vapour producing materials (organic soils/ biodegradable materials) or compounds that could vertically migrate into overlying buildings producing a potentially asphyxiating or explosive environment. Mine gas is also considered a potential risk.	Moderate
			Buildings and Services		
		Direct Contact, Uptake	Plants	Direct contact or uptake of contamination from the soil or groundwater could adversely affect any plants grown.	Moderate
Migration in the groundwater	Groundwater	Contaminants could impact the groundwater and migrate offsite.	Moderate		

The site was recorded to be generally flat-lying.

Mineshaft ref: 275664-002.
Grid ref: 275087, 664816.
Unnamed coal seam.

Rockhead was recorded at approximately 15 m bgl.

Surfaced in trees and rough vegetation.

Electrical Sub-station (immediately south-east of site)
(PCBs)

Mineshaft ref: 275664-001.
Grid ref: 275181, 664888.
Unnamed coal seam.

Mineshaft ref: 275664-036.
Grid ref: 275149, 664901.
Unnamed coal seam.

'Glasgow and Motherwell' groundwater was recorded to have an overall status of 'bad' in 2018.

-15 m bgl

Potential Source

- Potentially contaminated made ground.
- Ground gases.
- PCBs from electrical sub-station.

Potential Exposure Pathways

1. Outdoor ingestion of dust.
2. Indoor ingestion of dust.
3. Skin contact with outdoor soil.
4. Skin contact with indoor dust.
5. Outdoor inhalation of dust.
6. Indoor inhalation of dust.
7. Outdoor inhalation of soil vapour.
8. Indoor inhalation of soil vapour.
9. Inhalation of ground gases.
10. Contaminant uptake by vegetation.
11. Leaching of contaminants to the groundwater.
12. Contaminant migration in the groundwater.
13. Detrimental effects on buried concrete.
14. Permeation of plastic water supply pipes.

Potential Receptors

- A. Site users / construction personnel.
- B. Vegetation / fauna.
- C. Groundwater.
- D. Buried concrete (Service and foundations)
- E. Plastic water supply pipes.

7.0 IDENTIFICATION AND ASSESSMENT OF SITE SPECIFIC MINING RISKS

7.1 Risk Assessment

7.1.1 Due to the mining history of the site and surrounding area, it is prudent to carry out a full mining risk assessment. Table 10 has been derived from the researches, highlighting the risk relating to shallow mine-workings at the property. The risk is shown by the colouration in the boxes. Where red is shown, the risk is heightened and mitigation would be expected to be required for development. An 'orange' colouration indicates a suspicion of a potential risk that would need to be addressed in investigations and/or design, with a possible need for mitigation. Where there is a 'green' colouration, no significant risk is expected.

Table 10: Qualitative Mining Risk Assessment

Mining Issue	Yes	No	Risk Assessment
Underground mining (unrecorded and recorded shallow mining a number of coal seams)			The site is in a Coal Mining Reporting Area and a Development High risk Area. The Coal Authority Report (Appendix C) indicates that underground mining has taken place at the site. Underground mining is indicated in the Virtuewell, Kiltongue and Upper Drumgray Coal seams at depths of between 33m and 80m beneath the surface.
Mine entries (shafts and adits)			Three mine entries are indicated on site.
Coal mining geology (fissures)			None known
Record of past mine gas emissions			No records of past gas emissions on site, although monitoring should be undertaken during site investigation works.
Surface mining (opencast workings)			No records of opencast mining indicated within the site.

7.2 Mitigation Strategy Proposed

7.2.1 In view of the recorded geology and the conjectured mining conditions at the site, we recommend that rotary drilling is undertaken across the site to confirm the mining conditions. Following the probing, the extent of any areas of surface instability would be determined and any proposed buildings constructed within any conjectured areas of instability would be required to be stabilised by the implementation of drilling and grouting works to consolidate the workings. Stability measures should not be required in the car parks and open-space areas, but would be necessary for adoptable roads as this is a prerequisite of Local Authority adoption in RCC's. With regard to any open space areas, we would highlight that while mining may have taken place in these areas, the typical movements that may be expected should not present any significant health and safety risks to users. The exception would be where unrecorded mine entries collapse. In our experience, such work can be undertaken economically to facilitate residential development and a large number of such sites have been similarly treated in the past.

- 7.2.2 We consider that the development can proceed with due cognisance of the above mitigation measures. As highlighted, vigilance should be maintained during site works for any unrecorded mine entries. Where such features exists, these should be secured by grouting and/or capping.
- 7.2.3 Prior to the commencement of any investigations or treatment in coal mining areas, permission will be required from the Coal Authority to penetrate the seam. This is a standard requirement in all mining investigations where seams of coal may be entered or disturbed.

8.0 CONCLUSIONS AND RECOMMENDATIONS FOR DEVELOPMENT

8.1 General

8.1.1 The Phase I researches have indicated that the site could potentially be impacted by contamination relating to its previous usage. This would require further evaluation through Phase II investigations, including the testing of samples to enable the characterisation of the soils and groundwater bodies beneath the site. In addition, potential gas emissions sourced from biodegradable materials within made ground soils or abandoned mine-workings would require to be assessed through monitoring. The researches have indicated that the site is potentially at risk from mining related subsidence due to mine-workings.

8.1.2 Foundation options for any new development will be influenced by the thickness and condition of the made ground deposits as well as the nature of the natural superficial deposits. Significant thicknesses of made ground were recorded within the site.

8.2 Chemical Contamination

8.2.1 The site is currently occupied by the vacant Teleperformance building. The possibility of contaminated made ground being present due to the former historical activities cannot be discounted without suitable site investigations.

8.2.2 In order to address the potential risks to the various receptors highlighted, we advise that a programme of investigations should be instigated, as described, to examine the soils and groundwater conditions. This should examine potential contamination impacts and the pathways by which receptors may be at significant risk. The investigations should be targeted and non-targeted and will include boreholes and trial pits recovering samples of the soils and groundwater.

8.2.3 If contamination constraints were identified, these should be able to be remediated using widely utilised, cost effective and technically robust methods. Should asbestos contamination be identified in the soils, removal or capping of any contaminated soils could be undertaken.

8.3 Gas Emissions

8.3.1 The historical researches suggest that there is potential for fill to exist associated with the former industrial and mining activities on site site. In addition, the site is located in an area with a history of shallow mine workings which represent a risk of associated mine gas which would require assessment. Consequently, a programme of gas monitoring from standpipes installed in soils and rotary boreholes, is advised.

8.4 Foundations

8.4.1 Made ground soils were recorded associated with previous site usage. These made ground soils are unlikely to be suitable as a foundation bearing horizon. The natural soils appear suited to sustaining light to medium loaded structures, but may also be capable of tolerating significantly greater loadings. As such, if future proposals involve

the construction of a new development, investigations will be required to confirm the load bearing characteristics of the underlying natural soils.

8.5 Mining

8.5.1 The site is potentially underlain by shallow mine-workings which may present a risk to surface stability at the site. Detailed investigations and risk assessment are required. If areas of mining instability are identified, stabilisation by drilling and grouting will be required.

8.6 Development Considerations

8.6.1 A number of geo-environmental development considerations could arise from the recommended Phase II investigations. These include:

- *Remediation of contaminated land may be required.*
- *Gas Preclusion measures may be required.*
- *Foundations designs are likely to be determined by the thickness of made ground deposits.*
- *Mining instability may affect future development.*

We highlight that these considerations are to some extent speculative without the more detailed information that would arise following Phase II investigations, following which the impact of each should be re-assessed.

We trust that this will meet with your current requirements. However, should you require any further information, please do not hesitate to contact us.

Yours sincerely
MASON EVANS PARTNERSHIP

Introduction

The Environment Act 1995 has made site sensitivity a key issue, as the legislation pays as much attention to the pathways by which contamination could spread, and to the vulnerable targets of contamination, as it does the potential sources of contamination. For this reason, Landmark's Site Sensitivity maps and Datasheet(s) place great emphasis on statutory data provided by the Environment Agency/Natural Resources Wales and the Scottish Environment Protection Agency, it also incorporates data from Natural England (and the Scottish and Welsh equivalents) and Local Authorities; and highlights hydrogeological features required by environmental and geotechnical consultants. It does not include any information concerning past uses of land. The datasheet is produced by querying the Landmark database to a distance defined by the client from a site boundary provided by the client. In this datasheet the National Grid References (NGRs) are rounded to the nearest 10m in accordance with Landmark's agreements with a number of Data Suppliers.

Natural England Copyright Notice

Site of Special Scientific Interest, National Nature Reserve, Ramsar, Special Protection Area, Special Conservation Area, Marine Nature Reserve data (derived from Ordnance Survey 1:10000 raster) is provided by, and used with the permission of, Natural England who retain the copyright and Intellectual Property Rights for the data.

Scottish Natural Heritage Copyright

Contains SNH information licensed under the Open Government Licence v3.0.

Ove Arup Copyright Notice

The Mining Instability data was obtained on licence from Ove Arup & Partners Limited (for further information, contact mining.review@arup.com). No reproduction or further use of such Data is to be made without the prior written consent of Ove Arup & Partners Limited. The supplied Mining Instability data is derived from publicly available records and other third party sources and neither Ove Arup & Partners nor Landmark warrant the accuracy or completeness of such information or data.

Stantec Copyright Notice

The cavity data presented has been extracted from the PBA (now Stantec UK Ltd) enhanced version of the original DEFRA national cavity databases. Stantec UK Ltd retain the copyright & intellectual property rights in the data. Whilst all reasonable efforts are made to check that the information contained in the cavity databases is accurate we do not warrant that the data is complete or error free. The information is based upon our own researches and those collated from a number of external sources and is continually being augmented and updated by Stantec UK Ltd. In no event shall Stantec UK Ltd or Landmark be liable for any loss or damage including, without limitation, indirect or consequential loss or damage arising from the use of this data.

Radon Potential dataset Copyright Notice

Information supplied from a joint dataset compiled by The British Geological Survey and Public Health England.

Natural Resources Wales Copyright Notice

Contains Natural Resources Wales information © Natural Resources Wales and Database Right. All rights Reserved. Contains Ordnance Survey Data. Ordnance Survey Licence number 100019741. Crown Copyright and Database Right. Contains Natural Resources Wales information © Natural Resources Wales and Database Right. All rights Reserved. Some features of this information are based on digital spatial data licensed from the Centre for Ecology & Hydrology © NERC (CEH). Defra, Met Office and DARD Rivers Agency © Crown copyright. © Cranfield University. © James Hutton Institute. Contains OS data © Crown copyright and database right 2021. Land & Property Services © Crown copyright and database right.

Report Version v53.0

Data Type	Page Number	On Site	0 to 250m	251 to 500m	501 to 1000m (*up to 2000m)
Agency & Hydrological					
BGS Groundwater Flooding Susceptibility	pg 1	Yes	Yes	Yes	n/a
Contaminated Land Register Entries and Notices					
Discharge Consents	pg 7		1	7	7
Prosecutions Relating to Controlled Waters			n/a	n/a	n/a
Enforcement and Prohibition Notices

Source map scale - 1:10,560

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840's. In 1854 the 1:2,500 scale was adopted for mapping urban areas; these maps were used to update the 1:10,560 maps. The published date given therefore is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas. In the late 1940's, a Provisional Edition was produced, which updated the 1:10,560 mapping from a number of sources. The maps appear unfinished - with all military camps and other strategic sites removed. These maps were initially overprinted with the National Grid. In 1970, the first 1:10,000 maps were produced using the Transverse Mercator Projection. The revision process continued until recently, with new editions appearing every 10 years or so for urban areas.

Map Name(s) and Date(s)

Historical Map - Slice A

Order Details

Order Number: 279382591_1_1
 Customer Ref: P21-176 CF
 National Grid Reference: 275140, 664880
 Slice: A
 Site Area (Ha): 1.8
 Search Buffer (m): 1000

Site Details

69, Victoria Place, AIRDRIE, ML6 9BY
