Limitations

This report was prepared specifically for the Client's project and may not be appropriate to alternative schemes. The copyright for the report and licence for its use shall remain vested in Ashdown Site Investigation Limited (the Company) who disclaim all responsibility or liability (whether at common law or under the express or implied terms of the Contract between the Company and the Client) for any loss or damage of whatever nature in the event that this report is relied on by a third party, or is issued in circumstances or for projects for which it was not originally commissioned.

This report is not intended to be either an ecological, archaeological or flood risk assessment. An appropriate specialist should be consulted about any concerns that may arise in this regard.

EXECUTIVE SUMMARY

The following presents a summary of the main findings of the report. It is emphasised that no reliance should be placed on any individual point until the whole of the report has been read as other sections of the report may put into context the information contained herein.

It is proposed to redevelop the site of Reeves Garage, 104 Hythe Street, Dartford, to provide a 5 storey mixed use building containing commercial units on the ground floor, with residential units above.

The site is currently occupied by an operational vehicle repair garage/workshop building with associated areas of concrete hardstanding. Three underground former fuel tanks are understood to be present beneath the eastern part of the site.

The site was partly occupied by residential buildings and a school at the time of the earliest inspected historical map, dated 1885. A garage is indicated in the central part of the site on the c. 1960's mapping and a further garage building is identified in the western part of the site by the 1970's. The western garage building appears to have subsequently been removed.

The site lies within an area which formerly contained extensive large scale industries, including chemical works, iron foundries, gas works and mills.

Reference to geological datasets indicates that the site is expected to be underlain by the Alluvium overlying the White Chalk Subgroup.

The Alluvium is classed as Secondary Undifferentiated Strata. The White Chalk Subgroup is classed as a Principal Aquifer. The site lies within an Environment Agency Source Protection Zone I (Inner Source Protection Zone) with regard to the protection of the quality of groundwater that is abstracted for potable supply.

The preliminary contamination risk assessment has identified potential pollutant linkages relating to both proposed end users of the site and controlled waters.

An intrusive ground investigation is recommended in order to allow a quantitative assessment of the identified risks to be made.

1. INTRODUCTION

It is proposed to redevelop the site of Reeves Garage, 104 Hythe Street, Dartford, to provide a 5 storey mixed use building containing commercial units on the ground floor, with residential units above. A copy of the proposed development layout is presented in Appendix A.

The scope of the works covered by this report, and the terms and conditions under which they were undertaken, were set out within the offer letter Q8325, dated 6th March 2019. The instruction to proceed was received from Crown Coast Property Group Ltd.

The objectives of the works were to:

- a) Establish the expected geology, hydrogeology and hydrology at the site;
- b) Ascertain the development history and current site use; and
- c) Develop a preliminary conceptual model of the site identifying potential complete pollutant linkages relating to end users of the proposed development works, to controlled waters beneath and in the vicinity of the site, or to other off-site sensitive receptors, if identified.

The preliminary conceptual model has been based on the findings of a walkover survey and reference to historical Ordnance Survey maps and published geological and environmental information obtained from various sources.

Copies of the historical maps and geo-environmental data referred to in this report are presented within Appendix F.

2. WALKOVER SURVEY

The site comprises an irregular shaped plot of land located at the junction of Hythe Street and Victoria Road, Dartford, Kent. The site is centred on the approximate Ordnance Survey national grid reference TQ 5420 7450. A site location plan and site walkover plan are presented as Figure 1 and Figure 2, respectively. Photographs taken during the walkover survey are included in Appendix B.

The site comprises a single storey building in use as a vehicle repair garage/workshop, with areas of forecourt to the south east, north east and north west. The site is bounded by Victoria Road to the northeast and Hythe Street to the south east. A further building housing a vehicle service workshop/garage is located immediately to the north west. A large gas holder is located to the north west behind the buildings on the opposite side of Victoria Road.

To the southwest lies a largely vacant plot of land, within which are two large storage tanks and an associated pump house. It is understood that the tanks provide water for the fire sprinkler system of the retail units located further to the south west, beyond a railway viaduct.

The forecourt areas around the garage are surfaced with concrete and used for the storage of vehicles. A steel framework which appears to be associated with a former structure was present within the north western area.

A vehicle inspection pit was located within the western end of the garage workshop. Storage of numerous containers of engine oil, lubricants and other automotive fluids was observed elsewhere within the building. A small generator, waste storage bins, and several used oil containers were located outside, immediately adjacent to the west of the building.

Within the forecourt area to the east of the garage building several manhole covers were noted. Information supplied by the site owner indicates that 3 No. underground fuel tanks are still present beneath this area. One of the tanks is currently in use for the storage of waste oil, whilst the other two have apparently been decommissioned. However, information on the method of decommissioning, or any records pertaining to this, have not been made available.

The site and surrounding area are generally level.

3. ENVIRONMENTAL AND GEO-ENVIRONMENTAL DATA REVIEW

3.1 Geological and Hydrogeological Information

3.1.1 Expected Geology and Aquifer Designation

The stratigraphic succession that may be expected to underlie the site is presented in the following table.

Table 1. Expected Strata and Aquifer Designation

Type Stratum		Aquifer Designation		
Superficial	Alluvium	Secondary Undifferentiated Aquifer		
Bedrock	White Chalk Subgroup	Principal Aquifer		

Alluvium is a term for any material that has been transported and laid down by rivers. It can variably comprise sand and gravel, and, where deposited on flood plains may include

compressible organic clay and silt. Peat and sand horizons may be present within the deposits, indicating localised changes within the depositional regime.

The White Chalk Subgroup comprises a weak, white chalk locally with flint bands together with scattered nodular flints. It may be expected to have a deeply convoluted upper surface as a result of solution weathering. The presence of natural cavities in the chalk is very rare and solution features, if present, can be expected to be infilled with Quaternary deposits such as the Alluvium.

The infill material may be significantly weaker than the surrounding chalk. Solution features can comprise pipes extending to several metres deep into the chalk or conical depressions and basin shaped structures.

3.1.2 Mining and Natural Ground Hazards

Table 2. Mining and Natural Ground Subsidence Hazards from Envirocheck Data

Section	Risk Assessment
Coal Mining Affected Areas	In an area that might not be affected by coal mining
Non-Coal Mining Areas of Great Britain	No Hazard Identified
Potential for Collapsible Ground Stability Hazards	No Hazard Identified
Potential for Compressible Ground Stability Hazards	Very Low
Potential for Ground Dissolution Stability Hazards	No Hazard Identified
Potential for Landslide Ground Stability Hazards	Very Low
Potential for Running Sand Ground Stability Hazards	Very Low
Potential for Shrinking or Swelling Clay Ground Stability Hazards	Low

It should be noted that the assessment provided within the data represents a generic assessment only. A site-specific assessment would require the undertaking of an intrusive ground investigation.

Historically, chalk deposits were often mined locally. Most commonly historical mines characteristically comprise a narrow shaft with a number of chambers radiating from the base. These structures are colloquially known as "deneholes", "chalk-wells" or "chalkangles". The depth of the features reflects the depth to the underlying chalk bedrock. The shaft width was commonly in the order of 2m to 3m, widening out into galleries at depth. The chalk was extracted for soil improvement and was usually applied directly to fields though sometimes the chalk was processed, typically by burning in kilns where the chalk was used to produce quicklime (calcium oxide). Once they had reached their limits the mines were commonly capped. Various capping techniques were used; examples include the use of upturned trees or brick arching. Records pertaining to the distribution of these localised mines are incomplete, usually being limited to features marked as shafts or the occurrence of circular depressions on historic Ordnance Survey maps. In the field they are most likely to be visible as shallow depressions, if at all.

Site inspection and inspection of historical maps extending back in time to 1885 does not reveal the presence of any significant features at the site though, for reasons given above, their presence cannot be fully discounted. It is therefore recommended that all stripped formation levels should be inspected for evidence of historical backfilled shafts as a precaution.

Screening of the site was also undertaken by Terra Firma for past underground mining hazards and natural ground hazards. The screening report is included in Appendix C.

Based on this initial screen ground stability hazards are known or considered likely to have occurred within the vicinity of the site. The ground hazards that have been identified are past underground mining hazards relating to stone and natural ground hazards relating to clay subsidence.

Whilst the mine screening assessment assigns a generic risk to the underlying geology, the screening process does also consider the locations of known mines. Further assessment can be undertaken, if required, to provide more detailed comment specific to the site.

3.1.3 Radon

Table 3. Radon

Section	Risk Assessment
Radon Affected Areas	The site is reported to be within an area where less than 1% of properties are at or above the action level requiring radon gas protection measures to be installed in new buildings.
Radon Protection Measures	No radon protection measures are reported by the British Geological Survey to be necessary in the construction of new dwellings or extensions.

3.1.4 Groundwater Source Protection Zones

The site lies within an Environment Agency Source Protection Zone I (Inner Source Protection Zone) with regard to the protection of the quality of groundwater that is abstracted for potable supply.

3.1.5 Groundwater and Surface Water Abstraction Licences

The closest groundwater abstraction licence is recorded to lie 165m to the south east of the site. The abstraction is for non-evaporative cooling.

The closest surface water abstraction licence is recorded to lie 158m to the south east of the site. The abstraction is also for non-evaporative cooling.

3.1.6 Surface Water Features

The nearest recorded significant surface water feature is a pond, located 89m to the south east of the site.

3.1.7 Flooding

The site lies within an Environment Agency Flood Zone 3.

The site lies within an area where the British Geological Survey report the "Potential for Groundwater Flooding of Property Situated Below Ground Level".

The GeoSmart Groundwater Flood Risk (GW5) Map (GeoSmart, 2019)¹ concurs, and states that the risk of groundwater flooding at the site is 'moderate'.

Based on the susceptibility of the site to groundwater flooding, a groundwater flood risk assessment should be considered for the site.

3.2 **Data Review**

3.2.1 Agency & Hydrological Data

The data has been reviewed and any entries referring to locations on, or in close proximity to, the site that may pose a potential risk are discussed within the following table.

Table 4. Agency & Hydrogeological Data

Section	Discussion		
Local Authority Pollution Prevention and Control	Milestone Auto Services located 4m west of the site. Description: PG1/1 Waste oil burners, less than 0.4W net rated thermal input. Dated: 14 th June 2000. Status: Authorisation revoked.		
Pollution Incidents to Controlled Waters	An incident occurred in 1995 27m south of the site. The pollutant was oils and the incident was categorised as minor.		

3.1 Waste

The data has been reviewed and any entries referring to locations on, or in close proximity to, the site that may pose a potential risk are discussed within the following table.

Table 5. Waste Data

Section	Discussion	
Licensed Waste Management Facilities	William Thomas Cleary licensed waste management facility is located 210m north east of the site. Site Category: Metal Recycling Sites (Vehicle Dismantlers). Issued: 29 th December 2000. Surrendered: 10 th March 2011. Licence Status: Surrendered.	
Registered Waste Treatment or Disposal Sites	W T Cleary registered waste transfer site is located 114m north of the site. Site Category: Scrapyard – with Transfer Station. Max Input Rate: Very Small. Dated: 29 th December 2000. Licence Status: Operational.	

¹ GeoSmart Information Limited, 2019. National Groundwater Flood Risk Map (GW5)

3.2 Hazardous Substance

The data has been reviewed and any entries referring to locations on, or in close proximity to, the site that may pose a potential risk are discussed within the following table.

Table 6. Hazardous Substances Data

Section	Discussion
Planning Hazardous Substance Consents	British Gas Plc located 53m north west of the site. Hazardous Substance: Part C, Flammable Substance (Not in Parts A&B), Gas or gases flammable in air, when held as a gas, where amount held is >= 15 tonnes. Decision: Consent transferred. Bg Transco Plc located 58m north west of the site. Hazardous Substance: Liquefied extremely flammable gas (including LPG) and natural gas (whether liquified or not). Decision: Granted.

3.3 Industrial Land Use

The data has been reviewed and any entries referring to locations on, or in close proximity to, the site that may pose a potential risk are discussed within the following table.

Table 7. Industrial Land Use Data

Section	Discussion		
Contemporary Trade Directory Entries	Reeves Garage (active) garage services located on site. Milestone Garage Dartford Ltd (active) garage services located 8m west of the site. Milestone Auto Services (inactive) garage services located 8m west of the site. Milestone Auto Services (inactive) exhaust and shock absorber centre located 10m west of the site. All Cars & Vans Wanted (active) car breakdown & recovery services located 12m north of the site. Servicemaster London South East Ltd (active) carpet, curtain & upholstery cleaners located 20m north east of the site. Taber Engineering (active) precision engineers located 45m north of the site.		

3.4 Sensitive Land Use

The data has been reviewed and no sensitive land uses relevant to the proposed development have been identified within 500m of the site.

4. HISTORICAL MAP REVIEW

Historical Ordnance Survey maps covering the area of the site have been reviewed and are summarised in the following table.

It is noted that each map presents information applicable at the time of the survey (or revision date) and is subject to surveying and cartographic errors and/or advances. Revisions to maps are made at irregular intervals and it is possible that significant developments may have taken place on or within the vicinity of the site that are not shown on the maps.

'In the Vicinity of the Site' generally refers to features of relevance within approximately 250m of the site boundary but may also include more distant features if considered to be pertinent to the assessment of the development history.

Table 8. Summary of Significant Features Identified on Historical Maps

Map Details	On-Site	In the Vicinity of the Site
1885 1:2,500	The western part of the site is shown to be occupied by residential properties. An Infant School is indicated in the eastern part of the site.	A Gas Works is shown ~50m to the north west of the site. Two large Iron Foundries are shown ~60m to the south west on the opposite side of a railway track which lies ~40m to the south west. Phoenix Mill (Paper) is shown ~100m to the east. A very large Mill Pond lies to the south of the paper mill.
1897 1:2,500	The eastern part of the site now appears to be occupied by a single building identified as a Sunday School.	The road to the north is labelled as Gas Lane. Hythe Mill (Corn) is indicated beyond Hythe Street to the east. The Gas Works to the north west has increased in size with additional gasholders now shown. A second gasworks is also shown ~100m to the north east. Phoenix Mill to the west is shown to have been extended significantly and is labelled as a Chemical Manufactory. The Iron works to the south west is marked as disused.
1938 1:2,500		A large rectangular building is shown adjacent to the south west of the site. An Engineering Works is shown ~70m to the south west. A further large gasholder is shown at the gas works site to the north west. The Foundry's to the south west is now labelled as Engineering Works.
1961 1:1,250	A Garage is now indicated on the southern boundary, consistent with the location of the existing building. The large building in the east of the site is no longer shown.	The building to the south west is labelled as a works.
1975 1:1,250	The residential properties in the western part of the site are no longer shown. A second building, identified as a Garage, is now shown in the area where the existing steel framework was observed.	A Tank is identified ~15m to the south of the site. A new building adjacent to the northwest is identified as a works.

5. PRELIMINARY CONTAMINATION RISK ASSESSMENT

5.1 Introduction

The risk assessment considers the potential sources of contamination identified, the receptors that may be present in view of the development proposals and the contaminant pathways by which these may be linked. A complete pollutant linkage is only deemed to exist where all three are present and a site is considered suitable for use where no complete pollutant linkages are identified.

Where a complete pollutant linkage is deemed to be present, an assessment of the level of risk associated with the pollutant linkage has been carried out in line with current quidance².

The level of risk is determined using the risk matrix presented in the following table. Classifications of probability, consequence and risk are presented in Appendix D.

Table 9. Risk Assessment Matrix

		Probability			
		Very Low	Low	Moderate	High
	Very Minor	Negligible	Very Low	Low	Low/Moderate
6	Minor	Very Low	Low	Low/Moderate	Moderate
Consequence	Moderate	Low	Low/Moderate	Moderate	High
	Severe	Low/Moderate	Moderate	High	Very High

5.2 **Basis of Assessment**

The development is to comprise a new 5 storey block with a commercial unit on the ground floor and residential units above. Some limited decorative soft landscaping will be provided at ground level, but no privately owned gardens where end users could grow fruit and vegetables will be provided. Should the proposed development plans be altered, a revised risk assessment may be required.

It is noted that an asbestos survey of existing structures and infrastructure³ was beyond the brief of this report. The risk assessment has been undertaken on the basis that should asbestos be identified within buildings or infrastructure these materials will be removed appropriately by licensed contractors and asbestos materials disposed of in accordance with legal requirements prior to demolition or other works in order to avoid contaminating soils at the site.

5.3 **Potential Contamination Sources Identified**

The following potential sources of contamination have been identified by the preliminary contamination risk assessment:

- Existing/historical garage workshops, including vehicle inspection pit within existing buildina:
- Underground fuel/waste oil storage tanks within eastern area of site;

² Contaminated Land Risk Assessment: A guide to good practice, CIRIA C552, 2001.

³ As defined under Section 5(a) of the Control of Asbestos Regulations, 2012.

- Made ground associated with historical site development/demolition of buildings; and
- Off-site industrial land use.

5.4 Preliminary Conceptual Model

The preliminary conceptual model for the proposed development is presented in Appendix E.

5.5 Recommendations

Potential pollutant linkages have been identified by the preliminary risk assessment. An intrusive ground investigation should be undertaken to allow a quantitative assessment of the identified risks to be prepared.

The extent of the underground tanks should be determined by way of a ground penetrating radar survey, or similar. Boreholes should be excavated across the site, including beneath the footprint of the existing garage, and the former garage in the north west.

Adjacent to the vehicle inspection pit and the underground tanks, the boreholes should be progressed to a greater depth. Samples from across the site and from various depths should be tested for the potential contaminants identified within the conceptual model.

Standpipes should be installed within both shallow and deep boreholes. Shallow standpipes should be monitored to assess the potential risk from ground gases and fuel vapours. If groundwater is encountered within the deep standpipes, this should be sampled and tested for the presence of the potential contaminants identified within the conceptual model.

The results of the testing should be assessed in accordance with current best practice guidance and a refined conceptual model produced, identifying any complete pollutant linkages that are considered to be present. The report should make recommendations for any further assessment works that may be considered necessary, or should provide an options appraisal of potential remedial works.

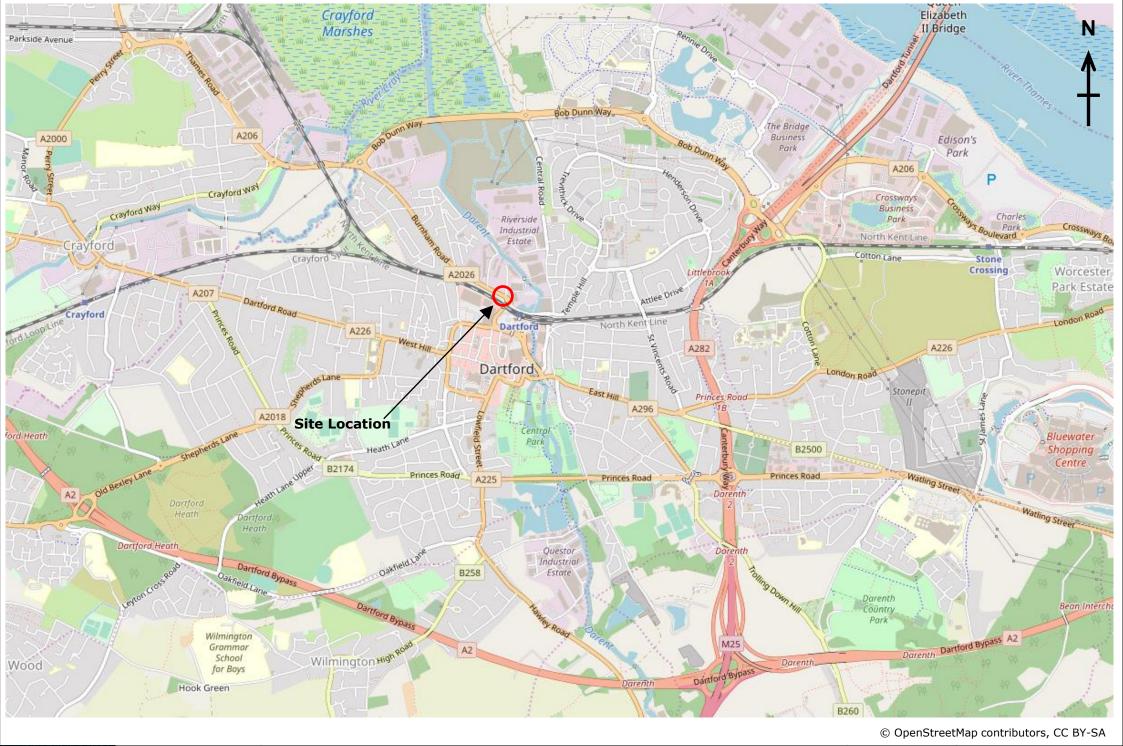

The intrusive works would be best undertaken following demolition of the existing building and removal of the existing concrete slabs. If works are to be undertaken prior to demolition, then follow up inspection of the formation level would be required once slabs have been removed to confirm the absence of any visual or olfactory evidence of suspected localised contamination.

NEXT STEPS

The Terrafirma Ground Report is an expert desktop assessment by an experienced geologist, including a professional opinion of the risk of instability from all natural and mining ground hazards. The report includes terms and conditions backed by $\mathfrak{L}10$ million professional indemnity per report.

APPENDIX D

Classification of Probability, Consequence and Risk

Probability of risk being realised					
Classification	Definition				
High	There is a pollution linkage and an event that either appears very likely in the short term and almost inevitable over the long term or there is evidence at the receptor of harm or pollution.				
Moderate	There is a pollution linkage and all the elements are present and in the right place, which means that it is probable that an event will occur. Circumstances are such that an event is not inevitable, but possible in the short term and likely over the long term.				
Low	There is a pollution linkage and circumstances are possible under which an event could occur. However, it is by no means certain that even over a longer period such event would take place and is less likely in the shorter term.				
Very Low	There is a pollution linkage but circumstances are such that it is improbable that an event would occur even in the very long term.				

Consequence of risk being realised					
Classification	Category	Definition			
	Human Health	Short term (acute) risk to human health likely to result in "significant harm" as defined by the Environment Protection Act 1990, Part IIA.			
Severe	Controlled Waters	Short term risk of pollution (note: Water Resources Act contains no scope for considering significance of pollution) of sensitive water resource.			
	Property	Catastrophic damage to buildings/property.			
	Ecological Systems	A short term risk to a particular ecosystem or organisation forming part of such ecosystem.			
	Human Health	Chronic damage to Human Health.			
Moderate	Controlled Waters	Pollution of sensitive water resources (note: Water Resources Act contains no scope for considering significance of pollution).			
	Ecological System	A significant change in a particular ecosystem or organism forming part of such ecosystem.			
	Controlled Waters	Pollution of non-sensitive water resources.			
Minor	Property	Significant damage to crops, buildings, structures and services.			
Millor	Ecological Systems	Damage to sensitive buildings/structures/services or the environment.			
Very Minor	Human Health	Non-permanent health effects to human health (easily prevented by means such as personal protective clothing, etc).			
	Property	Easily repairable effects of damage to buildings, structures and services.			
	Project	Harm, although not necessarily significant harm, which may result in a financial loss or expenditure to resolve.			

	Risk classification definitions				
Very High	There is a high probability that severe harm could arise to a designated receptor from an identified hazard, OR, there is evidence that severe harm to a designated receptor is currently happening. This risk, if realised, is likely to result in a substantial liability. Urgent investigation (if not undertaken already) and remediation are likely to be required.				
High	Harm is likely to arise to a designated receptor from an identified hazard. Realisation of the risk is likely to present a substantial liability. Urgent investigation (if not undertaken already) is required and remedial works may be necessary in the short term and are likely over the long term.				
Moderate	It is possible that harm could arise to a designated receptor from an identified hazard. However, it is relatively unlikely that any such harm would be severe, or if any harm were to occur it is more likely that the harm would be relatively mild. Investigation (if not already undertaken) is normally required to clarify the risk and to determine the potential liability. Some remedial works may be required in the longer term.				
Low	It is possible that harm could arise to a designated receptor from an identified hazard, but there is a low likelihood of this hazard occurring and if realised, harm would at worst normally be mild.				
Very Low	There is a low possibility that harm could arise to a receptor. In the event of such harm being realised, it is not likely to be severe.

Introduction

The Environment Act 1995 has made site sensitivity a key issue, as the legislation pays as much attention to the pathways by which contamination could spread, and to the vulnerable targets of contamination, as it does the potential sources of contamination.

For this reason, Landmark's Site Sensitivity maps and Datasheet(s) place great emphasis on statutory data provided by the Environment Agency/Natural Resources Wales and the Scottish Environment Protection Agency; it also incorporates data from Natural England (and the Scottish and Welsh equivalents) and Local Authorities; and highlights hydrogeological features required by environmental and geotechnical consultants. It does not include any information concerning past uses of land. The datasheet is produced by querying the Landmark database to a distance defined by the client from a site boundary provided by the client.

In this datasheet the National Grid References (NGRs) are rounded to the nearest 10m in accordance with Landmark's agreements with a number of Data Suppliers.

Geology 1:50,000 Maps

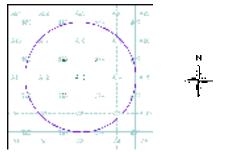

This report contains geological map extracts taken from the BGS Digital Geological map of Great Britain at 1:50,000 scale and is designed for users carrying out preliminary site assessments who require geological maps for the area around the site. This mapping may be more up to date than previously published paper maps.

The various geological layers - artificial and landslip deposits, superficial rife Vallous gettigical layers - a littigual and latitusity deposing, supermosting geology and solid (bedrock) geology are displayed in separate maps, but superimposed on the final 'Combined Surface Geology' map. All map legends feature on this page. Not all layers have complete nationwide coverage, so availability of data for relevant map sheets is indicated below.

Artificial Ground and Landslip

Artificial ground is a term used by BGS for those areas where the ground surface has been significantly modified by human activity. Information about previously developed ground is especially important, as it is often associated with potentially contaminated material, unpredictable engineering conditions and unstable ground.

Artificial ground includes:

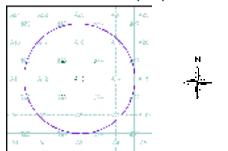

- Made ground man-made deposits such as embankments and spoil
- heaps on the natural ground surface.

 Worked ground areas where the ground has been cut away such as quarries and road cuttings.
- Infilled ground areas where the ground has been cut away then wholly or partially backfilled.
- Landscaped ground areas where the surface has been reshaped.

 Disturbed ground areas of ill-defined shallow or near surface mineral workings where it is impracticable to map made and worked ground separately.

Mass movement (landslip) deposits on BGS geological maps are primarily superficial deposits that have moved down slope under gravity to form landslips. These affect bedrock, other superficial deposits and artificial ground. The dataset also includes foundered strata, where the ground has collapsed due to subsidence.

Page 2 of 5

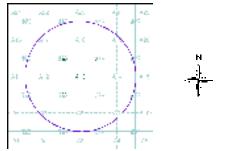

Superficial Geology

Superficial Deposits are the youngest geological deposits formed during the most recent period of geological time, the Quaternary, which extends back about 1.8 million years from the present.

They rest on older deposits or rocks referred to as Bedrock. This dataset contains Superficial deposits that are of natural origin and 'in place'. Other superficial strata may be held in the Mass Movement dataset where they have been moved, or in the Artificial Ground dataset where they are of man-made origin.

Most of these Superficial deposits are unconsolidated sediments such as gravel, sand, silt and clay, and onshore they form relatively thin, often discontinuous patches or larger spreads.

Page 3 of 5

Bedrock and Faults

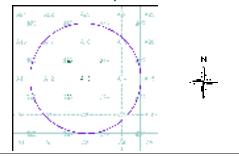

Bedrock geology is a term used for the main mass of rocks forming the Earth and are present everywhere, whether exposed at the surface in outcrops or concealed beneath superficial deposits or water.

The bedrock has formed over vast lengths of geological time ranging from ancient and highly altered rocks of the Proterozoic, some 2500 million years ago, or older, up to the relatively young Pliocene, 1.8 million years ago.

The bedrock geology includes many lithologies, often classified into three types based on origin: igneous, metamorphic and sedimentary.

The BGS Faults and Rock Segments dataset includes geological faults (e.g. normal, thrust), and thin beds mapped as lines (e.g. coal seam, gypsum bed). Some of these are linked to other particular 1:50,000 Geology datasets, for example, coal seams are part of the bedrock sequence, most faults and mineral veins primarily affect the bedrock but cut across the strata and post date its deposition.

Combined Surface Geology

The Combined Surface Geology map combines all the previous maps into one combined geological overview of your site.

Please consult the legends to the previous maps to interpret the Combined "Surface Geology" map.

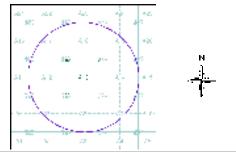

Additional Information

More information on 1:50,000 Geological mapping and explanations of rock classifications can be found on the BGS website. Using the LEX Codes in this report, further descriptions of rock types can be obtained by interrogating the 'BGS Lexicon of Named Rock Units'. This database can be accessed by following the 'Information and Data' link on the BGS website.

Published 1869 Source map scale - 1:10,560

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840's. In 1854 the 1:2,500 scale was adopted for mapping urban areas; these maps were used to update the 1:10,560 maps. The published date given therefore is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas. In the late 1940's, a Provisional Edition was produced, which updated the 1:10,560 mapping from a number of sources. The maps appear unfinished - with all military camps and other strategic sites removed. These maps were initially overprinted with the National Grid. In 1970, the first 1:10,000 maps were produced using the Transverse Mercator Projection. The revision process continued until recently, with new editions appearing every 10 years or so for urban areas.

Published 1939 - 1950 Source map scale - 1:10,560

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840's. In 1854 the 1:2,500 scale was adopted for mapping urban areas; these maps were used to update the 1:10,560 maps. The published date given therefore is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas. In the late 1940's, a Provisional Edition was produced, which updated the 1:10,560 mapping from a number of sources. The maps appear unfinished - with all military camps and other strategic sites removed. These maps were initially overprinted with the National Grid. In 1970, the first 1:10,000 maps were produced using the Transverse Mercator Projection. The revision process continued until recently, with new editions appearing every 10 years or so for urban areas.

Additional SIMs

Published 1979 - 1989

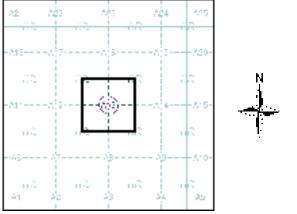

Source map scale - 1:1,250

The SIM cards (Ordnance Survey's `Survey of Information on Microfilm') are further, minor editions of mapping which were produced and published in between the main editions as an area was updated. They date from 1947 to 1994, and contain detailed information on buildings, roads and land-use. These maps were produced at both 1:2,500 and 1:1,250 scales.

Large-Scale National Grid Data

Published 1992

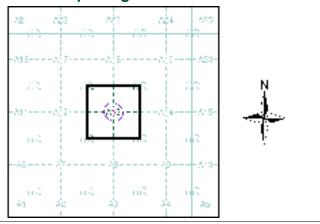

Source map scale - 1:1,250

'Large Scale National Grid Data' superseded SIM cards (Ordnance Survey's 'Survey of Information on Microfilm') in 1992, and continued to be produced until 1999. These maps were the fore-runners of digital mapping and so provide detailed information on houses and roads, but tend to show less topographic features such as vegetation. These maps were produced at both 1:2,500 and 1:1,250 scales.
