## SUMMARY

*An archaeological evaluation was carried out on behalf of The Environment Partnership (TEP) Ltd., in advance of a residential development in an area of archaeological potential. The main aim of the evaluation was to provide information on the extent, nature and significance of archaeological remains surviving on the site in order to further inform the local planning authority.*

*A geophysical survey had detected several linear anomalies and the evaluation was able to confirm that they reflected underlying archaeological features; namely a series of ditches.*

*The pottery assemblage was modest, but all the features yielded some pottery and this was largely confined to a single phase of use in the 4<sup>th</sup> century AD. This later Roman activity appears to represent parts of a bounded field system with a possible trackway. An associated settlement may lie to the east.*

*Ridge and furrow earthworks are present on the site which illustrate continued agricultural use during the medieval or post medieval period.*

# 1 INTRODUCTION

- 1.1 Outline planning permission has been granted by Melton Borough Council for a residential development of 10 dwellings, access and parking, on land to the north of Pasture Lane, Gaddesby, Leicestershire (Planning Ref: P/2014/01460). A geophysical survey had identified a series of anomalies thought likely to be archaeological.
- 1.2 Archaeology Warwickshire were commissioned to undertake an archaeological evaluation in accordance with a Written Scheme of Investigation (WSI) approved by the planning authority.
- 1.3 The fieldwork took place in November 2021 and this report presents the results of that work. The archive will be temporarily stored by Archaeology Warwickshire before deposition with Leicestershire Museums under the accession number X.A109.2021 and site code LGP21.
- 1.4 This work was carried out in accordance with the Chartered Institute for Archaeologists Standard and guidance for field evaluation (2020).

## 2 SITE LOCATION

- 2.1 The site is located on the north side of Pasture Lane, on the north side of the village of Gaddesby, Leicestershire, centred on National Grid Reference SK 69091358 (Fig 1). The site is bounded by residential properties to the east and west (Woodbine Cottage and Rose Cottage) and further agricultural land to the north. The site comprises the southern part of a parcel of agricultural land and is c.0.04ha in extent. There is a pond in the south-west corner and a second extending across the eastern site boundary. The site lies c.1km to the north of the Gaddesby Brook and it has a gentle sloping aspect towards the north.
- 2.2 The BGS (British Geological Survey 2021) records the underlying bedrock geology of Blue Lias Formation, mudstone, with overlying superficial deposits of Oadby Member, Diamicton.

### 3 ARCHAEOLOGICAL BACKGROUND

- 3.1 The site lies in an area of archaeological interest with evidence of settlement and agricultural activity from the prehistoric period to post-medieval.

#### Prehistoric

- 3.2 Around 180m to the west of the site, a mound or tumulus of uncertain date was destroyed prior to the construction of housing in the 1960s (Leicestershire Historic Environment Record ref: MLE3781). The mound was surrounded by a shallow ditch and medieval references to a 'Le Littelhill' and a 'Le Roundhill' suggests it may have been a prehistoric burial mound. A Middle Bronze Age spearhead (MLE6382) was identified to the south-east of site of the mound, c.180m to the south-west of the site.

#### Roman

- 3.3 Three foci of Roman finds have been identified within the village. On the opposite side of Pasture Lane to the site, various Roman artefacts including a brooch, 10 coins, a possible nail cleaner, spoon handle and over 40 sherds of pottery were recorded by metal detectors in the 1990s (MLE6023). A similar range of artefacts including 36 sherds of Roman pottery and two Roman coins were identified c.300m to the west (MLE16330). A third site c.840m south-east is indicated by six Roman coins, a lead bracelet, bow brooch, plate brooch and a possible piece of imbrex tile (MLE5976). These foci suggest either a very large or a multi-foci settlement.

#### Medieval

- 3.4 The site lies to the north of the historic settlement core of Gaddesby (MLE3783). Within the centre of the village (around 500m to the south) is the site of a late 12th century hall which was demolished in 1744 (MLE25365) and the 13th-14th century Church of St Luke (MLE11674).
- 3.5 Satellite imagery shows north-south aligned earthworks indicative of ridge and furrow cultivation across the site (there is no LiDAR data available for the site). This was corroborated by magnetometer survey (Cockcroft 2020).
- 3.6 Medieval artefacts (MLE6381; MLE6975, MLE8384) have been discovered around the village. On the opposite side off Pasture Lane an ampulla fragment, four jettons, an Edward I penny and an Elizabeth I threepence were metal detected (MLE6991).

### **Post-medieval & modern**

- 3.7 Rose Cottage, to the east of the site, is depicted on the First Edition Ordnance Survey map of 1884 (not reproduced). At this time the site was in agricultural use with a small structure and enclosure in the south-west corner and a pond along the eastern boundary. There was no change within the site by the date of the Second Edition Ordnance Survey map of 1902 (Fig 2) but Woodbine Cottage to the west had been constructed. By 1973 the small structure in the south-west had been demolished and a pond was depicted. There has been no further change since this date.

### **Previous archaeological investigations**

- 3.8 A magnetometer survey carried out across the site (Cockcroft 2020) did not report any definite archaeological responses, although several linear anomalies and isolated pit-like responses were reported as uncertain. Ridge and furrow ploughing was evident in the dataset.
- 3.9 A watching brief c.20m west of the site recorded remnants of ridge and furrow (Leicestershire Historic Environment Record ELE5335) and a metal detector survey on the opposite side of Pasture Lane reported a number of Roman artefacts (ELE1953). Similarly, fieldwalking and metal detecting around 370m to the west found concentrations of Roman pottery (ELE10969).

## 4 AIMS AND METHODS

- 4.1 The main aim of the evaluation was to determine if there are any significant archaeological remains in the area to be developed; to form an understanding of their value and their potential to shed light on the subsequent development of the area.
- 4.2 Secondary aims included placing the results in their wider, local and regional contexts as appropriate. The results of the evaluation were to be tied into regional research themes identified in *East Midlands Historic Environment Research Framework*, where warranted. These include those in relation to the Roman period such as rural settlement patterns and landscapes and artefacts: production, distribution and social identity.
- 4.3 The objectives were to locate, record and analyse archaeological materials and deposits and to disseminate the results in an appropriate format.
- 4.4 The development area was evaluated by means of 90m of trial trenching (two 30m x 1.8m trenches and two 15m x 1.8m trenches, Fig 3).
- 4.5 Topsoil and former ploughsoils were removed by an appropriate machine using a ditching bucket under archaeological supervision.

## 5 RESULTS

### Geological Natural

- 5.1 The geological natural across the site was silty clay and clay sediments with yellowish brown and greyish brown variations (102, 202, 302 and 402) exposed at a depth of 0.46-0.55m below the current ground surface.

### Deposit Sequence

- 5.2 Where not disturbed by anthropogenic activity, the clay substrate was directly overlain by a simple sequence of plough derived silty clay subsoil and topsoil. Archaeological features were encountered in Trenches 2, 3 and 4. They have been ascribed to phases according to datable evidence recovered from them and/or morphological characteristics.

### Roman

- 5.3 Gully 309 contained a single sherd of Samian pottery, which is suggestive of an early Roman phase of activity.
- 5.4 Two broadly parallel ditches, 403 and 406 were aligned west to east, corresponding closely to linear geophysical anomalies (Fig 3) and may represent a trackway. Ditch 403 was 1.24m wide and 0.52m deep (Fig 4, Section E).
- 5.5 Ditch 408 corresponded with a north-west to south-east geophysical linear anomaly (Fig 3) and was 0.89m wide and 0.34m deep (Fig 4; Section D).
- 5.6 Ditches 303, 305, 307, 315 and gully 309 were concentrated on the eastern side of the site and 303, 307, 315 and gully 309 were broadly east-west, although ditch 307 and gully 309 were slightly more northeast-southwest than the others (Fig 3). Ditch 303 was 1.78m wide and 0.44m deep and contained three sherds of 4<sup>th</sup> century pottery and animal bone fragments. It cut ditch 315 (Fig 4, Section A), from which 3 sherds of Black-Burnished Ware were recovered.
- 5.7 Ditch 305 was aligned north-south and incorporated a concentration of large sandstone, limestone and flint cobbles (306), each measuring up to 0.2m across by 0.05m thick. The stones, which exhibited no evidence for coursing or bonding and did not appear to form any coherent structure, extended into underlying dark grey silty clay

deposit 312 as well as overlying the upper fill of ditch 303 (304). A single large cobble was also present in the base of ditch 315, which had been recut by 303. The implication is that ditch 303, 305 and 315 may form part of the same feature, possibly comprising the corner of an enclosure, with the cobble concentration representing a collapsed bank or revetment.

### ***Post Medieval***

- 5.8 In Trench 2 a spread of large pebbles with post-medieval brick fragments (203) may have derived from a former structure although other explanations are possible
- 5.9 North-south aligned furrows were evident in the trenches. These represent the negative cuts created by non-reversible ploughs and corroborate the geophysical survey anomalies.
- 5.10 17th to 19th century pottery was recorded in the ploughsoil.

### ***Pottery Dr Jerry Evans***

- 5.11 Some 48 sherds of Roman and later pottery were recovered from the evaluation (Appendix B). The 41 sherds of Roman pottery weighed 458g, and the medieval and post-mediaeval pottery weighed 450g. The material was subject to a rapid scan with material recorded into fabrics and fabric classes within the Warwickshire Museum/OAU categories (Booth 2000).
- 5.12 The average Roman sherd weight was 11.2g, at the lower end of the usual range for lowland zone rural sites.
- 5.13 Late Harrold shell-tempered ware provide around 25% of the Roman material, confirming most of the pottery must come from later fourth century contexts. The assessment assemblage is too small to provide any usable information on fabric proportions. The material is similar to that from East Leake Quarry (Evans 2021).

### ***Other finds***

- 5.14 An assemblage of animal bone totalling 94 fragments was recovered from the evaluation (Appendix B). This included cattle bone recovered from ditch and gully contexts.

## 6 CONCLUSIONS

- 6.1 The evaluation was able to confirm that the linear anomalies reported in the geophysical survey relate to sub-surface archaeological features. These appear to relate to a Roman period bounded field system. There is some suggestion that a contemporary settlement lies to the east.
- 6.2 The pottery assemblage was not large, but all the features yielded some pottery, predominantly from the 4<sup>th</sup> century AD. The occurrence of cattle bones in the features may reflect the dominance of cattle farming in the later Roman period.
- 6.3 Evidence for ridge and furrow cultivation across most of the site illustrates the continued agricultural use during the late medieval or post medieval period.

## ACKNOWLEDGEMENTS

Archaeology Warwickshire would like to thank The Environment Partnership (TEP) Ltd. for commissioning the work and Chloe Cronogue-Freeman at Leicestershire County Council for representing the planning authority.
