### Arboricultural Impact Assessment Method Statement & Tree Protection Plan (to BS:5837 2012)

For

#### Mill Cottage, 5 Laverstoke Lane, Laverstoke RG28 7NY

Prepared for Sue Smith

Prepared by Trevor Heaps BSc, MICFor, M. Arbor. A.

Date: 9<sup>th</sup> January 2021

Ref: TH 2666

#### Summary

It is proposed to demolish the existing rear / side outbuildings, and construct a new, smaller rear / side outbuilding at Mill Cottage.

One Field Maple will need to be removed (mainly due to its poor structural condition).

Some basic tree protection measures and working methodology (in accordance with BS 5837:2012) will ensure the retained trees are not detrimentally affected during works.

The relationship between the proposal and retained trees is sustainable and will not result in any unreasonable pressure to carry out inappropriate tree works.

If the proposal is implemented in accordance with the recommendations laid out in this report, neither the trees or wider landscape will be adversely affected.

This is an arboriculturally defensible scheme and there are no (arboricultural) reasons why planning consent should not be granted.

#### 2.0 Instruction

2.1 We are to survey all significant trees that could be affected by the proposed works.

2.2 We are then to prepare a report to appraise the effect these works will have on any nearby trees and the surrounding landscape.

2.3 We are then to set out recommendations for the protection of the trees during development - in accordance with British Standard 5837:2012 'Trees in relation to design, demolition and construction – Recommendations' (BS5837).

#### 3.0 Drawings provided

3.1 Site Location + Block Plans – Ref. 20019 01A – Dated Nov 2020 – Drawn by Mathewson Waters Architects

#### 4.0 Report context

4.1 The site was surveyed by Trevor Heaps on the 9<sup>th</sup> January 2021.

4.2 The trees were surveyed from within the site at ground level. No climbed inspections were carried out and no root/soil samples were taken for analysis.

4.3 The trees were inspected based on the Visual Tree Assessment (VTA) developed by Mattheck & Breloer (The Body Language of Trees, 1994).

4.4 Tree heights, crown spreads and stem diameters were measured with a clinometer, a Disto laser measure and a diameter measuring tape respectively.

4.5 Small trees and shrubs (with stem diameters less than 75mm) were not surveyed.

4.6 This report is based on the information provided (i.e. site plans, proposed drawings, scales, measurements etc.) and our observations during the site visit.

4.7 This report will support a planning application or an application to discharge a tree-related condition and its purpose is to assist and inform the planning process.

4.8 This report does not set out the detailed, working specifications of tree protection measures and engineering / design features, but provides sufficient detail to demonstrate the feasibility of the scheme in principle.

4.9 The report does not assess the potential influence of trees upon load-bearing soils beneath existing and proposed structures (resulting from water abstraction by trees on shrinkable soils).

#### 5.0 Statutory tree protection

5.1 According to the Council's website (checked 09/01/2021), none of the trees within or adjacent to this site are covered by a Tree Preservation Order (TPO); however, the site is within the Laverstoke and Freefolk Conservation Area, which means that if any works are required to trees with a stem diameter of 75mm or above, then a Section 211 Notice must be served on the Council (unless approved by way of this report).

#### 6.0 Ecological constraints

6.1 The Wildlife and Countryside Act 1981 (as amended by the Countryside and Rights of Way Act2000) provides statutory protection to birds, bats and other species that inhabit trees.

6.2 In addition to any tree matters considered in this report, these protected animals could impose significant constraints on the use and timing of access to the site.

#### 7.0 The site

7.1 This property is situated within a leafy, residential part of Laverstoke.

#### 8.0 The soil and topography

8.1 The soils at this site were determined using information provided by the British Geological Survey and observations during the site visit.

8.2 The main site (front garden and house) is level with no adverse features; however the wooded area to the rear is on sloping land about 2-3m higher.

8.3 The soil texture is sandy loam. The soil parent material is river terrace sand and gravel. The soil is deep, and so a thick soil profile is likely. Soil (and any underlying parent Material) should be easily dug to a depth of more than one metre.

8.4 Given the information above, the soil has little potential of becoming compacted (which is harmful to tree roots); however, tree protection will not be relaxed.

#### 9.0 Arboricultural Impact Assessment (AIA) and Tree Protection Methods

9.1 Table 1 lists the <u>potential</u> effects the construction works will have on the subject trees. Mitigation measures are discussed in more detail below, and this information should be read in conjunction with the supporting Tree Protection Plan (TPP).

9.2 Further information on the subject trees is provided in Appendices 2 & 3.

The impacts on trees due to this development	Category A trees affected	Category B trees affected	Category C trees affected
Trees to be removed to facilitate development			T <sub>4</sub>
Physical damage to retained trees			S6, T <sub>7</sub>

#### Table 1: Potential effects on trees due to development

#### 9.3 Trees to be removed to facilitate development

9.3.1 Field Maple T<sub>4</sub> is leaning and suppressed due to the growth of the three Sycamores to the northeast (see photo 1). It also has a cracked stem from ground level to about 5m high (see photos 2-3 below).

Photo 1. The black arrow shows the group of 3 Sycamores, the red arrow shows the Field Maple T3

Photo 2. The lower part of the crack is starting to seal, but is a significant defect.

Photo 3. The upper parts of the crack are not sealing and the wood beneath is degrading.

9.3.2 Consent has recently been given to remove the three Sycamores; this will leave the defective Field Maple much more exposed and prone to failure. Therefore, the Field Maple should also be removed.

9.3.3 To mitigate, a group of three Silver Birches will be planted in roughly the same area as the three Sycamores (to be removed).

9.3.4 It is normally appropriate to deal with re-planting matters by condition or by way of a landscape plan; however, three potential re-planting locations have been shown on the TPP; and the following details can be confirmed at this stage:

- The new Silver Birches will be of standard size (about 2-3m high)
- The new trees will be planted in full accordance with current British Standards (BS 8545: From Nursery to Independence in the Landscape);
- Once planted, the trees will be regularly maintained (watered and weeded during the spring and summer months) for at least 5 years or until established.

#### 9.4 Physical damage to stems of retained trees

9.4.1 The lateral branches of the Portuguese Laurel S6 and Apple T<sub>7</sub> are potentially vulnerable to damage during demolition and construction (see photo 4).

9.4.2 To minimise this risk, protective fencing will be erected along their canopy extents (the hard surface of the driveway and side patio will protect any roots growing beneath).

#### 10.0 Conclusions

10.1 One Field Maple will need to be removed (mainly due to its poor condition).

10.2 To mitigate, a group of three Silver Birches will be planted within the site (post-construction).

10.3 The retained trees will be protected using up-to-date methodology and guidance provided by the current British Standards (BS 58378:2012). To this end, a site-specific AMS and TPP have been provided. These are found in Section 11 and Appendix 9 respectively.

10.4 Provided the recommendations laid out in this report are followed, the proposals will not detrimentally affect the trees and, with the suggested tree re-planting, will enhance the character and appearance of the conservation area.

10.5 The trees do not cause any significant conflicts in terms of construction activities, nor will any significant issues of post-development pressure be likely to emerge that could not be managed with routine, minor tree maintenance.

#### 11.0 The Arboricultural Method Statement (AMS)

11.1 Effective tree protection relies on following a logical sequence of events and arboricultural supervision. This AMS lays down the methodology for all construction works that may influence significant trees and recommendations for arboricultural supervision are provided in Section 12.

11.2 It is essential that this AMS is observed and adhered to. Therefore, a copy of this AMS <u>must</u> be issued to the building contractor to be integrated into their work schedule and <u>must</u> also be permanently made available on-site for the duration of development.

11.3 This AMS should be read in conjunction with the supporting Tree Protection Plan (TPP), which is found in Appendix 9.

11.4 At this site, operations are to occur in the following sequence (refer to Appendix 4 for further details on <u>underlined</u> methodology; which are listed in alphabetical order):

- Carry out tree work operations highlighted yellow in the tree data schedule (Appendix 2). All tree
  works are to be carried out by a competent and experienced arborist to current British Standards
  (see Appendix 5.9 for assistance finding a suitable arborist).
- 2. Erect <u>protective fencing</u> along the position(s) shown by the dashed red line/s on the TPP.
- 3. Provide a photographic record of all tree protection to arboricultural consultant this will be forwarded to and approved by the Council's Arboricultural Officer and must demonstrate that all aspects of tree and ground protection measures have been implemented in accordance with this Arboricultural Report. The tree protection measures shall be retained until completion of all works hereby permitted.
- 4. <u>Demolish</u> existing outbuilding/s
- 5. Commence construction of new outbuilding
- 6. Remove tree protection when all construction activity has ended.
- 7. Carry out tree planting and any other <u>landscaping</u> works.

#### 12.0 Arboricultural supervision

12.1 A suitably-qualified arboriculturalist will provide on-going supervision during construction. The occasions when supervision is required are outlined in Table 2. If the LPA wish to see further supervision, this matter can be dealt with by amending the report and/or by condition.

Supervision details	Required (Y / N)	When	Details	Nature	Sign off
Pre- commencement site meeting	N	Prior to any site activity	To ensure contractors are briefed & understand the AMS & TPP. A site supervisor will be appointed to oversee tree protection & the reporting of any damage to trees or deviation from the AMS - to the project arboriculturist / LPA	the AMS & TPP. A site be appointed to oversee a & the reporting of any or deviation from the AMS attendees	
Meeting with tree contractors	N	Prior to protective measures being installed	To ensure tree work instructions are clear and understood.	Informal meeting	<del>No follow up</del> required
Protective measure(s) check	Y	Prior to any site activity	To ensure that protective measures are fit- for-purposed and correctly positioned.	Site meeting with a site monitoring report to be prepared	Details of to be sent to LPA within 5 days
On-going supervision	N	Every 2 weeks during construction	To ensure that the protective measures have not been moved and continue to be fit-for-purpose.	Site meeting with a site monitoring report to be prepared	Details of to be sent to LPA within 5 days
Supervision of excavation works near trees	N	During construction	<del>To supervise key stages of works near trees</del> <del>(insert which / when)</del>	Site meeting with a site monitoring report to be prepared	Details of to be sent to LPA within 5 days
Meeting with landscape contractors	N	After construction	To provide advice on tree / shrub selection (if not conditioned)	Informal meeting	<del>No follow up required</del>

<b>Table 2:</b> Indicative arboricultural supervision requirements
--

12.2 A site inspection record (see Appendix 8) will be prepared after each visit and will state the condition of tree protection measures and outline any required remedial action (and timescales).

12.3 To demonstrate compliance, and to help the LPA discharge relevant planning conditions, all site monitoring reports will be forwarded to the LPAs arboricultural officer within 5 working days of the visit.

12.3 NOTE: It is the applicant's responsibility to arrange meeting dates with the arboriculturist.

#### 13.0 Signature

This report represents a true and factual account of the potential arboricultural impacts, and makes recommendations for appropriate protective measures, at the subject property.

Т8	Acer pseudoplatanus (Sycamore)	М	750	18	5	7.5	7.5	7.5	7.5	Normal	Normal	40+	A2		No works required

#### Appendix 3 - Tree data schedule explanatory notes

This section explains the terms used in the **Tree data schedule** (Appendix 2).

**Ref:** Each item of vegetation has its own unique number, prefixed by a letter such that:

<b>T1=</b> Tree	<b>S2</b> =Shrub or stump	G <sub>3</sub> =Group	H4=Hedge	W5=Woodland
II-IICC	<b>52</b> -511 ub of stump	uj-uloup	114–11cuge	<b>113</b> -1100ulallu

**Species:** Latin (and common names in brackets) are given.

#### Age:

- Y Young Usually less than 10 years' old
- **SM Semi-mature** Significant future growth to be expected, both in height and crown spread (typically below 30% of life expectancy)
- **EM Early-mature** Full height almost attained. Significant growth may be expected in terms of crown spread (typically 30-60% of life expectancy)
- **M Mature** Full height attained. Crown spread will increase but growth increments will be slight (typically 60% or more of life expectancy)
- **V Veteran** A level of maturity whereby significant management may be required to keep the tree in a safe condition
- **OM Over-mature -** As for veteran except management is not considered worthwhile

DBH (mm): Stem diameter, measured in mm, taken at 1.5m above ground level where possible.

Hgt. (m): Height: Measured from ground level to the top of the crown in metres.

**Can Hgt. (m): Crown height:** Measured from ground level to the lowest tips of the main crown begins in metres. Where the crown is unbalanced it is measured on the side deemed to be most relevant. This is usually the side facing the area of anticipated development.

#### Can N, S, E, W: - Canopy extents

Approximate radial crown spread measured to the four cardinal points (for individual trees only)

**Physio cond.:** Indicates the physiological condition of the tree as one of the following categories:

- Normal Healthy tree with no symptoms of significant disease
- Fair Tree with early signs of disease, small defects, decreased life expectancy, or evidence of less-thanaverage vigour for the species
- **Poor** Significant disease present, limited life expectancy, or with very low vigour for the species and evidence of physiological stress
- Very poor Tree is in advanced stages of physiological failure and is dying
- **Dead** No leaves or signs of life

**Struct cond.:** Indicates the structural condition of the tree as one of the following categories:

- Normal No significant structural defects noted
- Fair Some structural defects noted but remedial action not required at present
- Poor Significant defects noted resulting in a tree that requires regular monitoring or remedial action
- Very poor Major defects noted that compromise the safety of the tree. Remedial works or tree removal is likely to be required.
- **Dead** No leaves or signs of life

Life Exp.: The estimated number of years before the tree may require removal (<10), (10 - 20), (20 - 40), or (40+).

**Ret. Cat.: - Retention category:** BS5837:2012 Category where:

- **U** = **Trees unsuitable for retention**. Trees in such a condition that cannot realistically be retained as living trees in the context of the current land use for longer than 10 years. These trees are shown on the tree plans with red centres.
- **A** = **Trees of high quality**. Trees of high quality with an estimated remaining life expectancy of at least 40 years. These trees are shown on the tree plans with green centres.
- **B** = **Trees of moderate quality**. Trees of moderate quality with an estimated remaining life expectancy of at least 20 years. These trees are shown on the tree plans with blue centres.
- C = Trees of low quality. Trees of low quality with an estimated remaining life expectancy of at least 10 years, or young trees with a stem diameter below 150mm. These trees are shown on the tree plans with grey centres.

Trees of notable quality are graded as Category A or Category B. These trees are sometimes divided further into subcategories:

- Sub-category 1 is allocated where it has been assessed that the tree has mainly arboricultural qualities.
- Sub-category 2 is allocated where it is assessed that the tree has mainly landscape qualities.
- Subcategory 3 is allocated where it is assessed that the tree has mainly cultural qualities, including conservation.

Trees may be allocated more than one sub-category. All sub-categories carry equal weight, with for example an A<sub>3</sub> tree being of the same importance and priority as an A<sub>1</sub> tree.

**Comments:** Tree form and pruning history are also recorded along with an account of any significant defects.

**Rec's - Recommendations:** Usually based on any defects observed and intended to ensure that the tree is in an acceptable condition.

#### Appendix 4 – Specifications for tree protective measures

#### **Demolition of existing buildings**

Any existing structures to be removed, that are within or close to the RPAs of retained trees, shall be demolished using the 'top down, pull back' method. This shall proceed in a manner pulling the structure back into itself, working away from the trees.

Any machinery used during the demolition and clearance of existing buildings must work from a position outside of the RPAs of retained trees and/or be positioned on suitable ground protection.

To avoid unnecessary root disruption, the foundations of demolished buildings within in the RPAs of retained trees shall either be left in situ or broken up by hand (using a pneumatic drill) under arboricultural supervision (if specified).

#### Ground Protection (if needed)

The following is based on an extract from British Standard 5837:2012 - Trees in relation to design, demolition and construction- Recommendations.

Temporary ground protection should be able to support any traffic entering or using the site without being distorted or causing compaction of underlying soil and might comprise one of the following:

a) for pedestrian-movements only, a single thickness of scaffold boards placed either on top of a driven scaffold frame, to form a suspended walkway, or on top of a compression-resistant layer (e.g. 100 mm depth of woodchip), laid onto a geotextile membrane;

b) for pedestrian-operated plant up to a gross weight of 2 t, proprietary, inter-linked ground protection boards placed on top of a compression-resistant layer (e.g. 150 mm depth of woodchip), laid onto a geotextile membrane;

c) for wheeled or tracked construction traffic exceeding 2 t gross weight, an alternative system (e.g. proprietary systems or pre-cast reinforced concrete slabs) to an engineering specification designed in conjunction with arboricultural advice, to accommodate the likely loading to which it will be subjected.

The location of the temporary ground protection is shown on the tree protection plan and detailed within the arboricultural method statement.

In all cases, the objective should be to avoid compaction of the soil, which can arise from the single passage of a heavy vehicle, especially in wet conditions, so that tree root functions remain unimpaired.

All ground protection is to be maintained in good order, so it is fit for purpose throughout development. The ground protection will not be altered in any way, or prematurely removed without prior consent of the project arboriculturist or the LPA arboricultural officer.

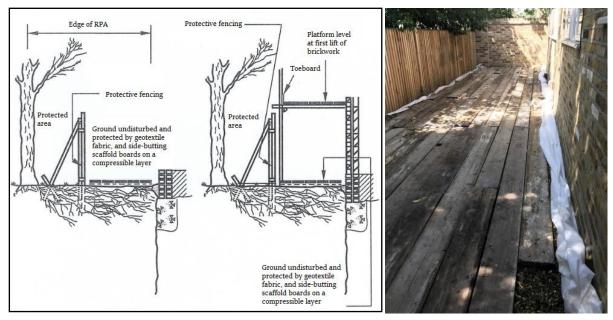

Figure 1: An example of ground protection on work areas within a RPA (BS 5837:2005).

Photo 2. An example of heavy duty ground protection.

Arboricultural Method Statement © Trevor Heaps Arboricultural Consultancy Ltd.

#### Protective fencing

The following is based on an extract from British Standard 5837:2012 - Trees in relation to design, demolition and construction- Recommendations.

The framework support (shown in Figure 2 and photo 1) is the usual method of support for 'Heras' fencing. Some variations are possible if site conditions are appropriate; i.e. support by wooden posts (75mm x 75mm x 2.75m) dug or concreted into the ground (dry mix concrete contained within a plastic bag), or if there is no pressure for access, a lighter form of netting on stakes.

Figure 2: Default specification for protective barrier (BS 5837:2012)

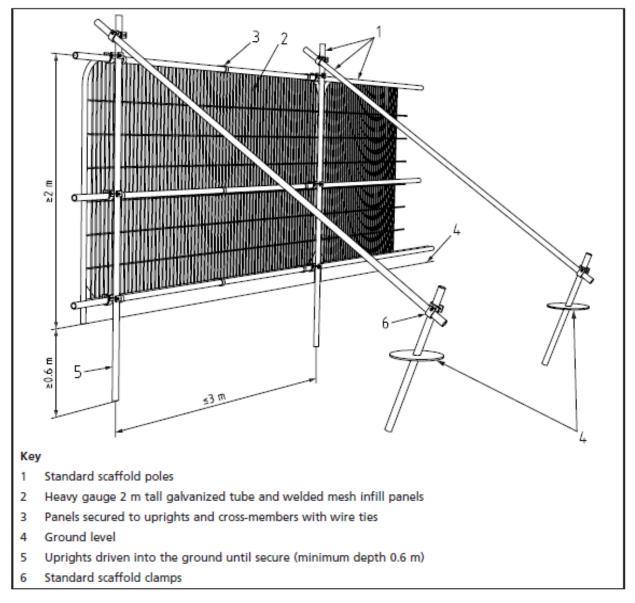

Photo 1: A worked example of the default specification for protective barrier (BS 837:2012)

Durable, all-weather signs are to be attached to the fencing (an example sign is provided below). These shall be printed, laminated and attached at regular intervals along the fencing.

Once erected, the protective fencing is to be regarded as sacrosanct and there is to be no access into the area protected by it - the construction exclusion zone (CEZ).

The protective fencing is to be maintained in good order, so it is fit for purpose throughout the construction process. The fencing will not be altered in any way, or prematurely removed without prior consent of the project arboriculturist and/or (if necessary) the LPA arboricultural officer.

Where specified in the AMS, the tree(s) stem/s shall be boxed off with wooden ply boards or wrapped in hessian and chestnut pale fencing. This will help avoid any direct damage to tree stems from passing machinery (see photo 2).

Photo 2: Trees protected by hessian & chestnut pale fencing / limbs protected by wooden boxing

# TREE PROTECTION FENCING

<u>This fencing must not be removed</u> or altered in any way without prior consultation with the project arboriculturist!

Please report any damage to trees and/or fencing to the site manager or the project arboriculturist Trevor Heaps

07957 763 53

#### <u>Removal of existing hard surfaces / rubble</u>

Working off either an existing hard surface or suitable <u>ground protection</u>, machinery can be used to carefully peel back and remove existing tarmac or concrete. Other surfaces, such as rubble or block paving, must be removed by hand.

Sub-bases can be removed mechanically if it is unlikely that roots will be found beneath it (this must be approved by the arboricultural consultant). Underlying (soft) ground levels must be retained and will not be excavated.

All newly exposed soil and exposed roots will be covered with damp hessian or 100 mm of topsoil.

Machinery can be used to move the topsoil close to the exposed area, but the topsoil itself will be spread by hand.

Machinery will not be sited on any exposed rooting area / RPA.

#### Soft landscaping within or close to the Root Protection Areas (RPAs) of retained trees

The following precautions are necessary to avoid damage to trees (where activities are to take place within their RPAs):

- Ground levels will not be changed;
- Soil must be of good quality and free of contaminants and other foreign objects potentially injurious to tree roots. The topsoil must satisfy the requirements of BS<sub>3</sub>88<sub>2:200</sub>;
- No heavy machinery will be operated within the RPAs of retained trees during the installation of soft landscaping;
- Unwanted vegetation shall be removed manually or by using systemic herbicide that will not damage tree roots;
- No fuels or chemicals shall be used or stored within these areas; and
- No irrigation or drainage pipes shall be installed within the RPAs

#### Appendix 5 – General precautions and further information

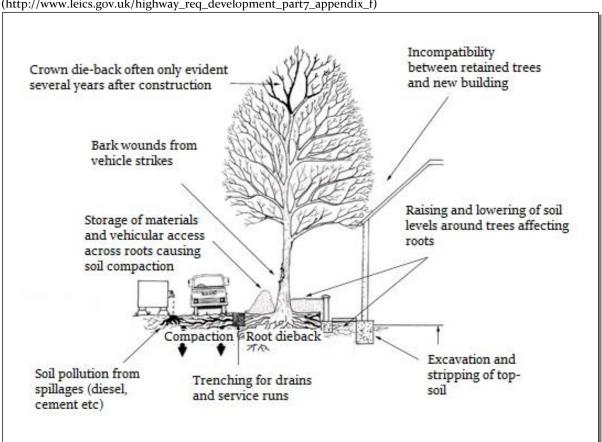

Figure 4: Common problems for trees on development sites
(http://www.leics.gov.uk/highway\_req\_development\_part7\_appendix\_f)

**5.1** Services and drainage: Surface run-off water shall be sent to soakaways located outside the RPAs of retained tree(s). If trenching is required within the RPA of retained trees to provide routes for services, this work shall be undertaken using mole boring and / or hand digging (under arboricultural supervision).

**5.2 Storage of materials:** No materials or spoil are to be stored within areas protected by protective fencing and/or ground protection. The same applies for existing hard surfaces that are being used as ground protection.

**5.3 Spillages:** If any cement residues fall within root protection areas, it shall be swept up, bagged and removed from site – it shall <u>not</u> be washed away with water.

**5.4 Demolition:** Where any existing structures are to be demolished, they will be done so inwardly (away from root protection areas / retained soil).

**5.5 Levels:** There is to be no alteration of ground levels within the area protected by protective fencing and/or ground protection, unless previously specified and agreed upon. The same applies for existing hard surfaces that are being used as ground protection.

**5.6 Fires:** No fires are to be lit within 20 metres of the stems of retained trees.

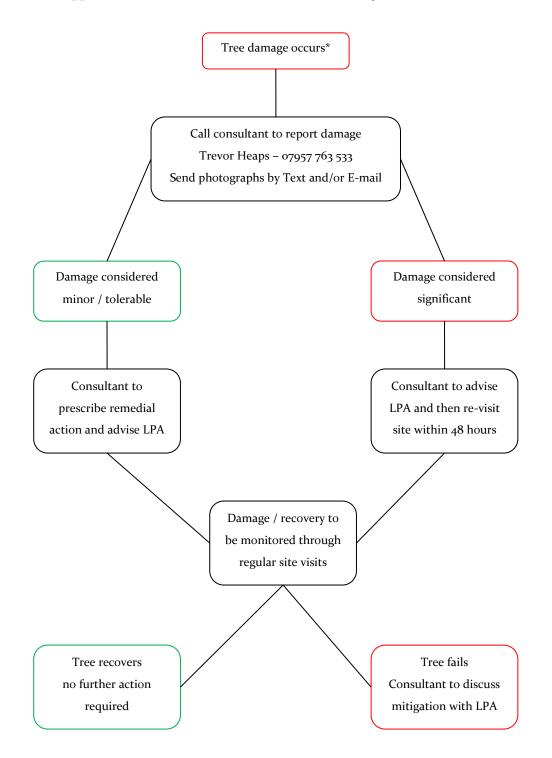

**5.7 Above ground damage to trees:** Care must be taken in planning the location and operation of machinery to avoid above ground damage to trees. BS5837 (2012) Section 6.2.4.1 states 'Planning of site operations should take sufficient account of wide loads, tall loads and plant with booms, jibs and counterweights (including drilling rigs) in order that they can operate without contacting retained trees. Such contact can result in serious damage to trees and might make their safe retention impossible. Consequently, any transit or traverse of plant in proximity to trees should be conducted under the supervision of a banksman, to ensure that adequate clearance of trees is always maintained. Access facilitation pruning should be undertaken where necessary to maintain this clearance.

**5.8 Remedial works and soil improvement:** Exposed soils are easily compacted resulting in loss of water and gaseous exchange; this can lead to root death (and subsequently tree death).

5.8.1 To relieve ground compaction, which may have resulted from the use of vehicles or by the storage of materials, the soils should be broken up to allow air to penetrate and for the soil structure to be restored. There are various methods to achieve this, such as: auguring the soil by hand / fork or pneumatic excavation (e.g. with an air spade); both should be combined with soil structure improvements (see 5.8.2).

5.8.2 The soil structure can be improved by incorporating a compost or mulch within the topsoil, of 75-100mm in depth. This can be spread over the surface and gently forked into the soil. If bark chip is used as mulch, NPK fertilizer should be added to counteract the nitrogen depletion of the soil. There is also the option of adding mycorrhizal fungal which may also improve root function.

**5.9 Choosing an arborist:** When appointing a tree works contractor, please only use properly qualified and experienced companies who comply with current British Standards (3998) and always check that they carry Public Liability Insurance within a minimum of £2,000,000 cover, and the relevant Employers Liability Insurance. A list of contractors approved by the Arboricultural Association can be found at <u>www.trees.org.uk</u> or by calling 01242 522 152.

Appendix 6 - Procedure to follow in case of damage to retained trees

\*Tree damage could include: unauthorised branch / root pruning; accidental damage to roots, stem, branches or crown; bark damage to vehicle / machinery strikes; and spillage of toxic materials within root protection areas (RPAs)

#### Appendix 7 - Induction form for all site personnel

Site name: .	

App. No.: .....

Appointed Site	Supervisor:	•••••
----------------	-------------	-------

- I have had explained to me by the Site Manager the key implications of the Arboricultural Method Statement relating to the development at the above site.
- I am aware that trees have shallow roots and any excavation works beneath the canopy could cause irreparable damage.
- I am aware that the tree protective fencing / ground protection must remain in its original position and must not be moved without the approval of the appointed Arboricultural Consultant.
- I understand that certain operations must be supervised by the appointed Arboricultural Consultant and that these must not start until the consultant is present and has given approval.
- I confirm that I will bring any concerns about potential damage to trees to the attention of the Site Manager.
- I am aware that I must not cause damage to any of the retained trees on or adjacent to the site. Damage may be caused by direct means (i.e. physical damage caused to roots or the trunk/branches of the tree) or by indirect means (e.g. by fire or toxic materials entering the rooting environment of the tree).
