Waterless Toilets

## How our waterless toilets work

First, liquids and solids are separated inside the unit, then a near constant current of air evaporates liquids and dehydrates the solid matter.

A light breeze is enough to turn the extractor, dragging air out of the chimney.

### The forced air flow:

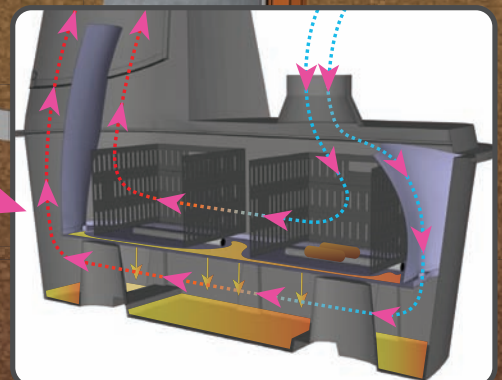

- Reduces waste volume by up to 90%
- Kills pathogenic and promotes aerobic bacteria
- Requires no additions such as straw or sawdust
- Works to eliminate odours

The unit heats up in the sun, air inside rises and the air flow accelerates.

Fresh air enters via the toilet bowl - thus eliminating odours.

Air is streamed over the separated waste, dehydrating solids and evaporating liquids.
