

⑤ SITE PLAN

1. Crown needs lifting on the branch that is sitting low on the public footpath to give clearance between the branch and people's heads. Giving ~~clearance~~ clearance between the ground and the crown.
2. Crown reduction is required on the outer parts of the tree crown in order to maintain the balance and the shape of the tree to prevent damage to the roofs, to avoid of neighbour and the street light. The spread of the tree is approximately 5 metres all around the tree. I believe this would be beneficial to all above mentioned if this was 2 to 3 metres but that said, this is ~~not an~~ an estimate and the welfare of the tree must be priority so I will be lead by your decision and the expertise of professional.
