### EXECUTIVE SUMMARY

Item	Description
<b>Client</b>	SBS Building Services Limited
<b>The Site</b>	Barn at Stoke Farm, Battsiford
<b>Report Objectives</b>	This report presents the findings of a desk-based study and site walkover survey with regards to potential ground contamination from historical and/or current uses of the site and surrounding area. A preliminary risk assessment has been carried out relating to ground conditions in respect of the proposed redevelopment of the site to a residential land use.
<b>Land Use History</b>	The site remained as fields until sometime between 1980 and 2000 when it was developed with a building. The site had been in use as a vehicle repair workshop and more recently, for storage. Ground cover inside the building and to the east consisted of concrete hardstanding.
<b>Development Proposals</b>	It is proposed to redevelop the site to a residential land use, comprising the conversion of the existing building. A private garden is proposed to the west and car parking to the east of the existing building.
<b>Geo-environmental Setting</b>	<p><b>Topography:</b> The site and surrounding area were relatively flat.</p> <p><b>Geology:</b> The superficial deposits underlying the site comprise Lowestoft Formation (chalky till). The bedrock geology consists of the Red Crag Formation (sand).</p> <p><b>Hydrogeology:</b> The superficial deposits are classified as a Secondary aquifer and the Red Crag as a Principal aquifer. The site lies within groundwater Source Protection Zone 3 (Total Catchment) and the nearest groundwater abstraction licence is at Charles Hall, 525m to the east, for general farming and domestic use.</p> <p><b>Hydrology:</b> The nearest surface watercourse to the site is a stream 120m to the west.</p>
<b>Phase 1 Preliminary Risk Assessment</b>	Based on the history and walkover survey of the site and immediate vicinity, sources of contamination have been identified as the use of the site as a vehicle repair workshop. However, the area of the workshop is to remain covered in hardstanding which will act as a barrier to any ground contamination. Thus, as there is no pathway, receptors will remain unaffected.
<b>Recommendations</b>	No intrusive investigation is considered necessary at this time. It is recommended that a watching brief for visual and olfactory signs of contamination is kept during groundworks, and if identified, work should stop and a risk assessment be carried out.
This summary forms part of the Phase 1 Geo-environmental Desk Study and Preliminary Risk Assessment report prepared by Sue Slaven and presents an overview of the key findings and conclusions. This summary should not be treated as an independent document and should be read as part of the complete report.

**Barn at Stoke Farm, Battsiford**  
**Phase 1 Geo-environmental Desk Study and Preliminary Risk Assessment**

**1. INTRODUCTION**

**1.1 Background Information**

1.1.1 Sue Slaven was commissioned by SBS Building Services Limited to carry out a preliminary investigation (also recognised as a Phase 1 Geo-environmental Desk Study) for the site known as Barn at Stoke Farm, Battsiford (“the site”). The purpose of the report is to provide information for the site with regards to the potential for ground contamination to be present. This is achieved using published information and by carrying out a walkover survey in relation to the proposed redevelopment of the site to a residential land use. It is understood that the report is to be submitted in support of a planning application to be submitted to Mid Suffolk Council.

1.1.2 The Desk Study comprises the first stage (i.e. Phase 1) of a geo-environmental assessment of a given site. The aim of the Desk Study is to identify potentially contaminative activities that may have occurred on-site and/or in the surrounding area and whether these pose a significant risk to identified receptors. For a significant risk to exist, three elements must be present in order to create a potential pollutant linkage (PPL), as follows:

- Source / Contaminant: activity / hazardous substance that has the potential to cause adverse impact.
- Receptor: target that may be affected by contamination, e.g. humans, property, land, controlled waters, flora and fauna.
- Pathway: a viable route whereby a hazardous substance may come into contact with the receptor.

**1.2 Objectives of the Investigation**

1.2.1 The objectives of this geo-environmental assessment are:

- To carry out a review of the geo-environmental setting of the site and surrounding area and assess the likelihood of ground contamination to exist.
- Prepare a preliminary risk assessment that assesses the presence of PPLs and whether further action is required.
- Produce a report for use by the Client.

1.2.2 In order to achieve these objectives, the following scope of works is proposed:

- A desk-based review of available information to include the history of the site and surrounding area.
- An interpretation of available geo-environmental data.
- Review any previous ground investigations reports prepared for the site.

- A walkover survey of the site and its environs.
- Develop a preliminary conceptual site model detailing all PPLs.
- Provide recommendations for a Phase 2 Ground Investigation, if required, based on the findings, to ensure that the site is suitable for use and/or proposed use.

1.2.3 The findings and conclusions of the risk assessment and recommendations have assumed that the site is to be redeveloped to a residential land use. However, if there is a subsequent change in land use, the risk assessments and conclusions presented in this report should be reviewed to determine whether they remain applicable.

1.2.4 This report has been devised to generally comply with the relevant principles and requirements of a range of guidance with regards to potentially contaminated land. These include:

- Babergh & Mid Suffolk District Councils. Contaminated Land Advice Note 1 – Guidance notes for developments on land which is potentially contaminated or where the proposed end use is sensitive (Version 2015/11).
- Babergh & Mid Suffolk District Councils. Contaminated Land Advice Note 2 – Technical Guidance for Investigating, Assessing and Remediating Land Contamination (Version 2015/11).
- BS 10175. Investigation of potentially contaminated sites - Code of practice.
- BS 5930. Code of practice for ground investigations.
- Defra. Contaminated Land (England) (Amendment) Regulations 2012 and Contaminated Land Statutory Guidance.
- Environment Agency. Land Contamination: Risk Management. October 2020.
- Environment Agency. Report GPLC1 - Guiding Principles for Land Contamination.
- Environment Agency. The Environment Agency's approach to groundwater protection.
- HCA. National Planning Policy Framework.
- Part IIA of the Environmental Protection Act, 1990.

### **1.3 Previous Investigations**

1.3.1 A Phase 1 Geo-environmental Desk Study and Preliminary Risk Assessment had been carried out for the area adjacent to the north of the site in September 2022 by Sue Slaven. Thus, the information presented therein with regards to the site's history and environmental setting is considered to remain relevant and has been adapted for the site.

### **1.4 Report Limitations and Constraints**

1.4.1 Sue Slaven's service constraints and report limitations are presented in Appendix A and a description of the environmental risk assessment methodology and terminology is presented in Appendix B. In preparation of this report, it is assumed that any information provided to Sue Slaven by the client or its representatives in connection with the commission is accurate, complete and not misleading. However, the accuracy or validity of this information cannot be

guaranteed. This also consists of publicly available information including that which may be present on the Internet.

1.4.2 This report does not include specific investigation / identification for the presence of potential Asbestos Containing Materials (ACMs), Japanese Knotweed or defects within any structures that may be present on-site. However, it may be noted that these could be present on-site, as detailed within this report. Specialist contractors should then be commissioned to make assessments of these aspects, if required.

1.4.3 It should be noted that there were no consultations with the Local Authority or the Environment Agency by Sue Slaven at the time of writing this report.

## 1.5 Development Proposals

1.5.1 It is understood that the site is to be redeveloped to a residential land use, comprising the conversion of the existing building. A private garden is proposed to the west and car parking to the east of the existing building.

## 2. SITE LOCATION AND DESCRIPTION

### 2.1 Site Location

2.1.1 The site location is indicated on Figure 2 and a brief description of the site is presented in Table 1.

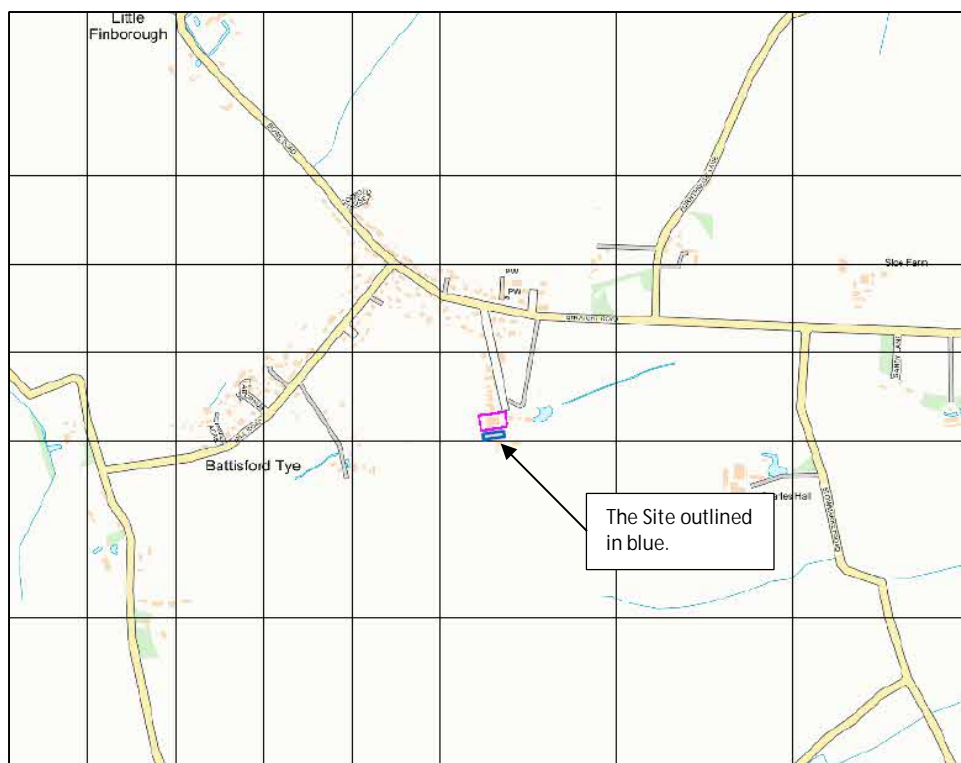

Figure 1 Site Location (not to scale)

**Table 1 Summary of the Site and its Environs**

<b>Site Address</b>	Stoke Farm, Stoke Farm Drive, Straight Road, Battsiford
<b>Location</b>	The site is situated in the south-eastern part of the village of Battsiford in a predominantly agricultural area. The town of Needham Market is located approximately 5.6km to the east of the site.
<b>Grid Reference</b>	602720, 253840
<b>Site Area</b>	0.05ha approximately

## 2.2 Site Description

- 2.2.1 A site visit was undertaken on 4 October 2023 by Sue Slaven. The site was accessed from Stoke Farm Drive, which was a single-track gravel lane orientated north - south, that led off Straight Road further to the north. The site consisted of a single storey barn that had been partitioned into two and was in use for the storage of domestic and vehicle maintenance items within the northern side and storage of fruit and vegetables within the southern side. The barn had previously been in use as a vehicle repair workshop. The building was of brick construction with metal doors on the eastern side and possible asbestos sheeting roof, together with gutters and drainpipes that may also contain asbestos. Ground cover within the building comprised concrete hardstanding.
- 2.2.2 The ground to the east of the barn was predominantly covered in concrete hardstanding, particularly in the front of the doors, together with some bare ground. In front of the building were wooden pallets, wooden crates of clean empty glass bottles, crates of roofing tiles, crates of concrete slabs, pile of crushed hardcore, plastic crates of apples etc. To the rear of the building was an area of grass upon which were windows and doors, Heras fencing, a garage door, concrete slabs, slabs of thick cardboard, roof tiles, concrete blocks, bricks, a domestic oil tank etc. To the side of the building, on its southern side, was also a strip of grass, upon which were builders bags, wooden pallets and crates, a portable toilet, an IBC container etc. These were stockpiled materials as part of the development of the site further to the north.
- 2.2.3 A bare ground track lead from the area to the east of the site, to the south of the barn and then to the west and led to caravans and small buildings further to the north-west of the site, which were in use for pottery operations.
- 2.2.4 The northern side of the barn was immediately adjacent to a building, which was of metal sheeting with brick lower walls. This was then adjacent to a large brick-built barn of double height with a brick single-storey lean-to on the northern and western sides. It is possible that the barn and the lean-to buildings comprised asbestos sheeting roofs, gutters and drainpipes. These buildings were in use for the processing of apples into juice from the orchards that surrounded the site. All of these buildings comprised concrete floors. A small brick building was to the east of these, which also had a concrete floor, and was in use for processing the apples. There was also a separate wooden portable building.

- 2.2.5 The ground cover to the east of the buildings comprised concrete hardstanding with grass surrounding the wooden portable building. Beyond the concrete was unmade ground. To the front of the buildings, i.e. to the south and east, were several items that related to the apple processing business, together with building materials. This included stacked empty wooden crates, wooden crates full of apples, large rolls of insulation materials, wooden pallets, IBC containers, small machinery for processing apples, stacks of plastic sheeting and small empty drums.
- 2.2.5 On the grass area, to the rear of the buildings, and to the north of the site, were piles of logs and cut down trees, piles of soil (gravelly clay), logs within metal crates, pile of waste wood, a crate of wooden planks, metal fencing and/or gates, pallets, pile of recovered broken concrete slabs, a dilapidated wooden shed and windows and doors. It is understood that these have been stored within this area whilst development of a site for residential use was taking place at the northern end of Stoke Farm Road.
- 2.2.6 Further south of the site was a series of three shipping containers, two buildings (one of which was in use as part of the pottery workshop), a skip full of rubbish etc., with an apple orchard beyond. To the east of the site were residential properties, including a bungalow and Stoke Farmhouse, and residential development had occurred on land to the north of the farmyard. To the west was the track with an apple orchard beyond.
- 2.2.7 There were no significant signs of visual or olfactory contamination either on site or in the surrounding area. A selection of photographs is included within Appendix C.

### **3. HISTORY OF THE SITE AND IMMEDIATE VICINITY**

#### **3.1 General**

- 3.1.1 A summary of the historical development of the site and immediate vicinity is presented below, which has been based on historical Ordnance Survey (OS) maps obtained from Envirocheck®, a selection of which are included in Appendix D. The age and general activity/land use can often be defined from the layout of structures depicted on historical OS maps, however, specific elements of site operations may not be determined from these maps. Only off-site features present within a radius of 250m of the site are considered relevant.

#### **3.2 Historical Maps**

##### ***1885 (1:2,500)***

- 3.2.1 The site was occupied by small fields with a small pond in the southern sector and a track that lead from the farmyard to the north to the fields further south. The farmyard to the north and north-east comprised four separate buildings as part of Stoke Farm. A track led from the road to the north, in-between two of the buildings towards the south-west and then continued southwards. Farmland surrounded the site, with the village 220m to the north.

---

**1904 (1:2,500)**

- 3.2.2 The site consisted of two tracks that lead from the farmyard to the north to the fields further south. It is possible that one of the buildings within the farmyard had been demolished. There was an orchard to the south-west of the site and a pond to the north.

**1958 (1:10,560)**

- 3.2.3 A small building had been erected in the southern sector of the site. The pond was no longer present and there were small buildings 30m further to the north and east.

**1975 (1:2,500)**

- 3.2.4 The site had become the northern sector of a larger field with a track adjacent to the east. The area to the north of the site had been redeveloped with one large barn and adjoining buildings to the north and west. There were a series of buildings further to the north and the farm buildings to the north-east had been demolished, with Stoke Farmhouse and two outbuildings remaining. Residential buildings had been erected to the north-east and south-east of the site and an orchard was immediately to the west and further to the south.

**1980 (1:10,00)**

- 3.4.5 The site and surrounding area remained unchanged.

**2000 (1:10,000)**

- 3.2.6 The site had been developed with a building that was situated immediately adjacent with a building to the north.

**2022 (1:10,000)**

- 3.2.7 Additional buildings had been erected to the south of the site.

**3.3 Other Historical Information**

- 3.3.1 It is understood that the processing of apples, including storing, pressing and bottling, on-site commenced in 1995. The on-site building operated as a vehicle repair workshop that ceased operations in 2019.

**3.4 Planning History**

- 3.4.1 A review of Mid Suffolk Council's planning website was carried out with regards to planning applications relating to the site and surrounding area, using "IP14 2NA" as the search term. There were 12 records dating back to June 1991. Four records related to the residential development of the area to the north of the farmyard, one record related to the

amendment/extension of an existing property to the north. Three records related to Stoke Farm, in the near vicinity of the site, and were for the erection of an agricultural building, three pottery kilns for recreational use and the use of land to the west of the site for a caravan / campsite. The site adjacent to the north received planning approval for the conversion of the barn and lean-to to a residential use in May 2019 and more recently, in October 2022, has received planning permission for the erection of two detached residential dwellings.

- 3.4.2 The site was the subject of two planning applications submitted in 1991 and 2000 by P Wilson Motors and were for the erection of a covered area to serve as a loading bay and the conversion of an agricultural building to light industrial use.

## **4. ENVIRONMENTAL SETTING**

### **4.1 General**

- 4.1.1 A summary of the environmental background information (geology, hydrology, hydrogeology and sites of ecological interest) is presented below. The information has been obtained from that which is publicly available and an Envirocheck® report, which is included as Appendix E of this report. This information, together with the other information included within this report, represent the base data used to formulate the conceptual site model.

### **4.2 Geology**

- 4.2.1 The geological appraisal has been compiled using the following references:

- BGS Website – 4 October 2023 ((<https://www.bgs.ac.uk/map-viewers/bgs-geology-viewer/>))
- Envirocheck Report

- 4.2.2 The records indicate that superficial deposits underlying the site comprise the Lowestoft Formation, which forms an extensive sheet of chalky till, together with sands and gravels, silts and clays. The till is characterised by its chalk and flint content. The bedrock geology consists of the Red Crag Formation, which is described as coarse-grained, poorly sorted, cross-bedded shelly sands. There are two records of boreholes having been drilled in the vicinity, as follows:

- A borehole was drilled in 1935 to a depth of 112m at Nayland Farm, located 310m to the south-west of the site. Ground conditions were recorded as Drift overlying Upper Chalk.
- A borehole was drilled in 1894 to a depth of 35.7m at Battsford Tye, 435m to the north-west of the site. The borehole was used as a public well, supplying 28 houses and became disused in 1960. Ground conditions were described as “boulder clay” to the depth of the borehole.

- 4.2.3 The site is not situated in an area where radon protective measures are necessary in the construction of new buildings.

---

### 4.3 Hydrogeology

4.3.1 The hydrogeological appraisal has been compiled using the following references:

- Envirocheck Report
- MAGIC Website – 4 October 2023 (<http://www.magic.gov.uk/MagicMap.aspx>)

4.3.2 The superficial deposits are classified as a Secondary aquifer and the bedrock geology as a Principal aquifer. The site is located within groundwater Source Protection Zone 3 (Total Catchment) and the nearest groundwater abstraction licence is from a borehole located at Charles Hall, 525m to the east, for general farming and domestic use. There was a borehole located at Stoke Farm that was used for spray irrigation, however, the licence has been revoked.

### 4.4 Hydrology

4.4.1 The hydrological appraisal has been compiled using the following references:

- Envirocheck Report
- Historical Maps
- <https://flood-map-for-planning.service.gov.uk/>

4.4.2 The nearest surface water course is a stream located 120m to the west of the site. The site is located within Flood Zone 1, which indicates a low probability of flooding. A drainage ditch was located on the northern boundary of the site, although this was dry at the time of the walkover survey. There are no records of discharge consents within a 250m radius of the site.

### 4.5 Ecology / Archaeology

4.5.1 The ecological and archaeological appraisals have been compiled using the following references:

- Envirocheck Report
- MAGIC Website – 4 October 2023 (<http://www.magic.gov.uk/MagicMap.aspx>)

4.5.2 There are no statutory sites of ecological significance (e.g. Ramsar, Special Protection Area, a Site of Special Scientific Interest, Special Area of Conservation) within a radius of 250m of the site. There are also no archaeological features within 250m. There is one Grade 2 listed building within 250m of the site, which is Stoke Farmhouse located 40m to the north-east.

---

## 5. POTENTIALLY CONTAMINATIVE USES OF THE SITE AND ITS ENVIRONS

### 5.1 General

5.1.1 Reviews of the Envirocheck report, historical maps and the MAGIC website, as above, were carried out with regards of industrial processes within 250m of the site, together with observations made during the walkover survey.

### 5.2 Waste

5.2.1 There were no records of historical and operational landfill sites or waste treatment and waste management facilities within 250m of the site.

### 5.3 Statutory Authorisations

5.3.1 There are no records of sites subject to Local Authority Pollution Prevent Control (LAPPC), Control of Major Accident Sites (COMAH) or Explosives Sites within a 250m radius of the site. There were also no records of sites subject to Notification of Installations Handling Hazardous Substances (NIHHS), Registered Radioactive Substances or Hazardous Substances Consent.

### 5.4 Other Possible Contaminative Uses

#### *Quarrying*

5.4.1 There are no records of mineral sites or quarries within 250m of the site.

#### *Fuel Sites*

5.4.2 There were no operational or obsolete petrol stations within 250m of the site.

#### *Contemporary Trade Directory*

5.4.3 There are no records of active trades within a 250m radius of the site, although processing of apples occurs within the buildings immediately to the north of the site.

#### *Unexploded Ordnance*

5.4.4 According to the Zetica Bomb Risk Map for Suffolk, there is a negligible risk of unexploded ordnance in the area.

## 6. HAZARD ASSESSMENT & PRELIMINARY CONCEPTUAL SITE MODEL

### 6.1 Background

6.1.1 The hazard identification is based on the assumption that the site is to be redeveloped to a residential use with private gardens. It is assumed that residents can grow their own fruit and vegetables and that potable water supply will be underground. As described in Appendix B, current Government policy involves a 'suitable for use' approach to the control and treatment of contaminated land in which remedial action is only required where:

- the contamination poses unacceptable, actual or potential risk to health or the environment; and
- there are appropriate and cost-effective means available to do so, considering the actual or intended end-use of the site.

6.1.2 If the land is being used only for certain purposes, the number of pathways by which the identified receptors might be exposed to will be limited, so that less extensive and costly remediation measures would be needed to reduce the risk to below a given level than would be the case for all types of actual or potential use. The land would then be 'suitable for use'.

6.1.3 When assessing the potential hazards and liabilities relating to land contamination, the following issues must be addressed:

- Does the site present a threat to the public or occupiers in its current state?
- Will the contaminants present a hazard to site operatives, or the surrounding environment, during redevelopment?
- Will there be a threat to end-users of the site? and
- Is there a potential for future liabilities due to off-site migration of contaminants?

### 6.2 Potential Sources of Contamination

6.2.1 For the purpose of this assessment, the potential contaminants of concern have been considered according to whether they are likely to have originated from on-site or off-site sources.

#### ***Potential On-site Sources of Contamination***

6.2.2 The site was developed with a single building in the period between 1980 and 2000, as part of a larger farmyard. The site was then in use as a vehicle repair workshop that was in operation in the years between 2000 and 2019. The workshop and the area to the east was covered in concrete hardstanding, which would act as a barrier to any contamination reaching the underlying ground and there were no signs of contamination on the ground. It is understood that the area is to remain covered in hardstanding. Thus, no pathway can be established. It is possible that the existing building is likely to comprise asbestos containing

materials within the roofs, gutters and drainpipes, however, it is understood that a specialist contractor has been commissioned to remove this material.

- 6.2.3 A pond was on-site in 1885, however, this was no longer present in 1958, which indicates infilling with material of an unknown nature. However, as this occurred more than 60 years, it is unlikely that significant contamination will remain.

#### ***Potential Off-site Sources of Contamination***

- 6.2.3 Potential sources of off-site contamination can be identified as the following:

- The farmyard immediately to the north of the site has been occupied by farm buildings since at least 1885, when these were demolished and the site redeveloped with three adjoining buildings sometime between 1958 and 1975. Another adjoining building was subsequently erected by 2000. The site has been in use for the processing of apples since 1995 with the buildings being used for the storing, pressing and bottling of apples. Ground cover across the site comprised concrete hardstanding, which is understood to be of a significant thickness within the buildings to withhold the weight of apples. However, planning permission has been granted for the redevelopment of this area to residential, which will involve the removal of buildings and hardstanding. The present buildings are likely to comprise asbestos containing materials within the roofs, gutters and drainpipes, however, if it understood that a specialist contractor has been commissioned to remove this material.
- A pond formerly located immediately to the east, which were present in 1904, although no longer shown on the 1958 map indicating infilling. However, as this occurred more than 60 years, it is unlikely that significant contamination will remain. In addition, there were no signs during the walkover survey.
- Former farm buildings to the north-east of the site that were present in 1885, although these were demolished by 1975 and the area redeveloped to residential.

### **6.3 Potential Receptors of Contamination**

- 6.3.1 For any given site, potential receptors can include: current and future site users / occupiers, construction workers, neighbouring land, on-site buildings / hardstanding / underground services, controlled waters (ground and surface), flora and fauna. These receptors incorporate those normally required by the Local Authority to be considered in their planning conditions relating to land contamination.

- 6.3.2 For this site, however, the receptors are considered to be as follows:

#### ***On-site***

- Current and future site occupiers (i.e. orchard workers, construction workers, residents).
- Buildings and underground services.
- Groundwater (Secondary aquifer overlying Principal aquifer).

### ***Off-site***

- Apple processing to the north.
- Residential properties to the east.
- Orchards and orchard workers to the west and south-west.

6.3.3 The preliminary assessment of risks undertaken for the development considers potential risks to receptors identified above. It should be noted that not all possible contaminant linkages may be formed between sources and receptors.

## **6.4 Identification of Pathways**

6.4.1 If contaminants are present in the ground, there are a number of potential pathways that enable human receptors to come into contact or be exposed to them. The most direct pathways, considered under UK legislation, can be summarised as follows:

- Ingestion of outdoor soil, indoor dust, home grown vegetables or of soil attached to home grown vegetables.
- Dermal contact with outdoor soil and/or indoor dust.
- Inhalation of outdoor/indoor dust, outdoor/indoor soil vapour.

6.4.2 In addition to direct exposure pathways principally affecting human health, there are a number of physical transport mechanisms / pathways that may also exist at any given site, including:

- Downward and lateral movement of contaminants in soil either by gravity or through being 'leached' by percolating rainwater to controlled waters.
- Lateral migration of contaminants dissolved in groundwater.
- Volatilisation of contaminants from groundwater or unsaturated soils into buildings or outdoor air.
- Migration of ground gas (carbon dioxide and methane) into buildings or confined spaces.
- Direct seepage / ingress or leaching of contaminants from soil into subsurface drains or water supply pipework.
- Direct contact with buildings and hardstanding.
- Potential phytotoxic effects on sensitive landscaping plants and uptake by fauna.

### ***Human Health***

6.4.3 The site is currently occupied by a building with a concrete floor, which was in use for storage. Ground cover immediately surrounding the building was of concrete hardstanding to the east and grass to the south and west, which was in use for the storage of building materials. The site is to be developed to a residential use with a private garden, thus potential pathways are possible such as long-term soil/dust inhalation/ingestion and dermal contact. However, no pathway between potential ground contamination and receptors has been established due to the current and future presence of hardstanding, which will act as a barrier.

6.4.4 Contact with contaminants during demolition and site clearance works is typically a short-term hazard, mainly concerning construction/ground workers. Potential risks are repeated contact with contaminated ground containing substances that are skin irritants and may cause dermatitis. Therefore, with respect to site operatives, it would be prudent to exercise good hygiene practices, e.g. the use of gloves, the avoidance of any eating and smoking on-site, and the provision of washing facilities. Assuming good site practices are followed, such incidents should be considered a low risk.

#### ***Ground Gas***

6.4.5 There is the potential for ground gas (carbon dioxide and methane) to enter future permanent buildings if the site is located within 250m of a landfill site or infilled ground and ground conditions allow for the migration of ground gas. However, no significant sources of ground gas have been identified.

#### ***Pathways to Controlled Waters***

6.4.6 The site is underlain by a Secondary aquifer, which overlies a Principal aquifer and there are no surface watercourses within the near vicinity. Thus, groundwater is considered to be sensitive to the potential presence of ground contamination. However, ground conditions are likely to comprise gravelly clay, which will act as a barrier to the migration of any contaminants that may be present in the ground.

#### ***Other Pathways***

6.4.7 Other potential pathways that are possibly less significant to the site although still require consideration are: potential phytotoxic effects on sensitive landscaping plants; chemical attack on foundations and services and permeation of contaminants through domestic water pipes. The area was surrounded by an apple orchard and the buildings currently on-site showed no signs of damage (although a structural survey would be required to confirm this). The ground is likely to be gravelly clay, which would act as a barrier to any potential on-site ground contamination.

### **6.5 Preliminary Conceptual Site Model and Hazard Assessment**

6.5.1 As part of a Preliminary Risk Assessment, a Preliminary Conceptual Site Model (PCSM) is formed, which assists with identifying potential contaminant linkages (source – pathway – receptor) using information obtained during the desk study. The preliminary hazard assessment is a qualitative assessment of the risks posed by each viable pollution link identified, as summarised in Appendix B. However, as the ground is covered with concrete hardstanding and is to remain covered in hardstanding, pathways cannot be established between potential ground contamination and receptors.

---

## 7. CONCLUSIONS AND RECOMMENDATIONS

### 7.1 Environmental Risk Assessment

7.1.1 A preliminary risk assessment has been carried out based on the contaminant – pathway - receptor model. However, following an assessment of the history of the site and surrounding area, a review of available information and walkover survey, a potential source of contamination has been identified as a vehicle repair workshop that occupied the site in the period between 2000 and 2019. However, the ground within the workshop and to the east of the building is of concrete hardstanding which will act as a barrier between the ground and receptors. It is understood that the area is to remain covered in hardstanding. Thus, pathways cannot be established and identified receptors will remain unaffected.

### 7.2 Recommendations for Further Investigative Works

7.2.1 No intrusive investigation works are considered necessary at this stage.

### 7.3 Recommendations for Works during Development

7.3.1 It is recommended that any deleterious material encountered during groundworks is removed from site, together with impacted soils beneath. All materials for off-site disposal should be removed to an appropriately licensed waste management facility: disposal being carried out in compliance with S.34 of the EPA, “Duty of Care”.

7.3.2 A watching brief for visual and olfactory signs of contamination is recommended during groundworks. It is recommended that construction workers are made aware of visual and olfactory signs of contamination through training such as Toolbox Talks. If suspected contaminated soils, such as asbestos, significant ashy soils (e.g. as a result of fires), unusual, brightly coloured or significantly oily or odorous material are encountered, the following procedures are to be adhered to:

1. All site works at the position of the suspected contamination will stop.
2. A suitably trained geo-environmental engineer should assess the visual and olfactory observations of the ground and the extent of contamination and the Client and the Local Authority should be informed of the discovery.
3. The suspected contaminated material will be investigated and tested appropriately in accordance with assessed risks. The investigation works will be carried out in the presence of a suitably qualified geo-environmental engineer. The investigation works will involve the collection of solid samples for testing and, using visual and olfactory observations of the ground, delineate the area over which contaminated materials are present.
4. The unexpected contaminated material will either be left in situ or be stockpiled (except if suspected to be asbestos) whilst testing is carried out and suitable assessments completed to determine whether the material can be re-used on site or requires disposal as appropriate.

5. The testing suite will be determined by the independent geo-environmental specialist based on visual and olfactory observations.
6. Test results will be compared against current assessment criteria suitable for the future use of the area of the site affected.
7. Where the material is left in situ awaiting results, it will either be reburied or covered with plastic sheeting.
8. Where the potentially contaminated material is to be temporarily stockpiled, it will be placed either on a prepared surface of clay, or on 2000-gauge Visqueen sheeting (or other impermeable surface) and covered to prevent dust and odour emissions.
9. Any areas where unexpected visual or olfactory ground contamination is identified will be surveyed and testing results incorporated into a Verification Report.
10. A photographic record will be made of relevant observations.
11. The results of the investigation and testing of any suspect unexpected contamination will be used to determine the relevant actions. After consultation with the Local Authority, materials should either be:
  - re-used in areas where test results indicate that it meets compliance targets so it can be re-used without treatment; or
  - treatment of material on site to meet compliance targets so it can be re-used; or
  - removal from site to a suitably licensed landfill or permitted treatment facility.
12. A Verification Report will be produced for the work.

#### **7.4 Health & Safety**

- 7.4.1 As outlined within the HSE publication “Successful Health and Safety Management – HSG65”, this report can be used to inform the contractor’s development of safe systems of work and the information used as an input to the safety management system. The contents of this report may be used to supplement the contents of the Health and Safety File as required under the Construction Design and Management (CDM) Regulations 2015.

### Service Constraints, Report Limitations and Planning Requirements

---

### Service Constraints, Report Limitations and Planning Requirements

This consultancy contract, report and the site investigation (together comprise the "Services") were compiled and carried out by Sue Slaven for the Client as named on the front of this report (the "Client") on the basis of a defined programme and scope of works and the terms of a contract between Sue Slaven and the Client. The Services were performed by Sue Slaven with all reasonable skill and care ordinarily exercised by a reasonable environmental consultant at the time the Services were performed. Further, and in particular, the Services were performed by Sue Slaven taking into account the limits of the scope of works required by the client, the prevailing site conditions, the timescale involved and resources, including financial and manpower resources, agreed between Sue Slaven and the client. Sue Slaven cannot accept responsibility to any parties whatsoever, following the issue of this report, for any matters arising which may be considered outwith the agreed scope of works.

Other than that expressly contained in the above paragraph, Sue Slaven provides no other representation or warranty whether express or implied, in relation to the Services. Unless otherwise agreed, this report has been prepared exclusively for the use and reliance of the client in accordance with generally accepted consulting practices and for the intended purposes, as stated in the agreement under which this work was completed. This report remains the property of Sue Slaven until payment of the relevant invoice has been received in full. This report may not be relied upon, or transferred to, by any other party without the written agreement of Sue Slaven. If a third party relies on this report, it does so wholly at its own and sole risk and Sue Slaven disclaims any liability to such parties.

It is Sue Slaven's understanding that this report is to be used for the purpose described in the introduction to the report. That purpose was a significant factor in determining the scope and level of the Services. Should the purpose for which the report is used, or the proposed use of the site, change, this report may no longer be valid and any further use of, or reliance upon the report in those circumstances by the client without Sue Slaven's review and advice shall be at the client's sole and own risk.

The information contained in this report is protected by disclosure under Part 3 of the Environmental Information Regulations 2004 pursuant to the provisions of Regulation 12(5) without the consent in writing of Sue Slaven.

The report was prepared in the month stated on the front of the report and should be read in light of any subsequent changes in legislation, statutory requirements and industry practices. Ground conditions can also change over time and further investigations or assessment should be made if there is any significant delay in acting on the findings of this report. The passage of time may result in changes in site conditions, regulatory or other legal provisions, technology or economic conditions which could render the report inaccurate or unreliable. The information and conclusions contained in this report should not be relied upon in the future without the written advice of Sue Slaven. In the absence of such written advice, reliance on the report in the future shall be at the client's own and sole risk. Should Sue Slaven be requested to review the report in the future, Sue Slaven shall be entitled to additional payment at the then existing rate or such other terms as may be agreed between Sue Slaven and the client.

The observations and conclusions described in this report are based solely upon the Services that were provided pursuant to the agreement between the client and Sue Slaven. Sue Slaven has not performed any observations, investigations, studies or testing not specifically set out or mentioned within this report. Sue Slaven is not liable for the existence of any condition, the discovery of which would require performance of services not otherwise contained in the Services. For the avoidance of doubt, unless otherwise expressly referred to in the introduction to this report, Sue Slaven did not seek to evaluate the presence on or off the site of asbestos, electromagnetic fields, lead paint, radon gas or other radioactive or hazardous materials (including plants).

The Services are based upon Sue Slaven's observations of existing physical conditions at the site, together with Sue Slaven's interpretation of information including documentation, obtained from third parties and from the client on the history and usage of the site. The findings and recommendations contained in this report are based in part upon information provided by third parties, and whilst Sue Slaven has no reason to doubt the accuracy and that it has been provided in full from those it was requested from, the items relied on have not been verified.

No responsibility can be accepted for errors within third party items presented in this report. Furthermore, Sue Slaven was not authorised and did not attempt to independently verify the accuracy or completeness of information, documentation or materials received from the client or third parties, including laboratories and information services, during the performance of the Services. Sue Slaven is not liable for any inaccurate information or conclusions, the discovery of which inaccuracies required the doing of any act including the gathering of any information which was not reasonably available to Sue Slaven and including the doing of any independent investigation of the information provided to Sue Slaven, save as otherwise provided in the terms of the contract between the client and Sue Slaven.

Any site drawing(s) provided in this report is (are) not meant to be an accurate base plan, but is (are) used to present the general relative locations of features on, and surrounding, the site.

### **Planning Requirements**

This report has been prepared and authorised by Sue Slaven who is competent as defined in the National Planning Policy Framework (NPPF, 2012).

## **Appendix B**

### **Environmental Risk Assessment Methodology & Terminology**

---

ENVIRONMENTAL RISK ASSESSMENT  
METHODOLOGY & TERMINOLOGY

LEGISLATION OVERVIEW

This report includes hazard identification and environmental risk assessment in line with the risk-based methods referred to in relevant UK legislation and guidance. Government environmental policy is based upon a "suitable for use approach," which is relevant to both the current use of land and also to any proposed future use. The contaminated land regime is the statutory regime for remediation of contaminated land that causes an unacceptable level of risk and is set out in Part 2A of the Environmental Protection Act 1990 ("EPA 1990"). The main objective of introducing the Part IIA regime is to provide an improved system for the identification and remediation of land where contamination is causing unacceptable risks to human health or the wider environment given the current use and circumstances of the land. Part IIA provides a statutory definition of contaminated land under Section 78A(2) as:

"any land which appears to the Local Authority in whose area it is situated to be in such a condition, by reason of substances in, on, or under the land, that: (a) Significant harm is being caused or there is a significant possibility of such harm being caused; or (b) Pollution of controlled waters is being, or is likely to be, caused."

In order to assist in establishing if there is a "significant possibility of significant harm", there must be a "contaminant linkage" for harm to exist. That means there must be a source(s) of contamination, sensitive receptors present and a connection or pathway between the two. This combination of contaminant-pathway-receptor is termed a "contaminant linkage or CPR linkage."

In the planning process, guidance is provided by National Planning Policy Framework (NPPF, March 2012) which requires that a site which has been developed shall not be capable of being determined "contaminated land" under Part IIA. In practice, Planning Authorities require sites being developed to have a lower level of risk post-development than the higher level of risk that is required in order to determine a site as being contaminated in accordance with Part IIA. This is to ensure that there is a suitable zone of safety below the level for Part IIA determination and prevent recently developed sites becoming reclassified as contaminated land if there are future legislative or technical changes (e.g. a substance is subsequently found to be more toxic than previously assessed which increases its hazard).

The criteria for assessing concentrations of contaminants and hence determining whether a site represents a hazard are based on a range of techniques, models and guidance. Within this context, it is relevant to note that Government objectives are:

- (a) to identify and remove unacceptable risks to human health and the environment;
- (b) to seek to bring damaged land back into beneficial use;
- (c) to seek to ensure that the cost burdens faced by individuals, companies and society as a whole are proportionate, manageable and economically sustainable.

These three objectives underlie the "suitable for use" approach to risk management and remediation of contaminated land. The "suitable for use" approach focuses on the risks caused by land contamination. The approach recognises that the risks presented by any given level of contamination will vary greatly according to the use of the land and a wide range of other factors, such as the underlying geology of the site. Risks are therefore assessed on a site-specific basis.

The "suitable for use" approach then consists of three elements:

- (a) ensuring that land is suitable for its current use - in other words, identifying any land where contamination is causing unacceptable risks to human health and the environment, assessed on the basis of the current use and circumstances of the land, and returning such land to a condition where such risks no longer arise ("remediating" the land); the contaminated land regime provides the regulatory mechanisms to achieve this;

- (b) *ensuring that land is made suitable for any new use, as planning permission is given for that new use - in other words, assessing the potential risks from contamination, on the basis of the proposed future use and circumstances, before permission is given for the development and, where necessary to avoid unacceptable risks to human health and the environment, remediating the land before the new use commences; this is the role of the town and country planning and building control regimes; and*
- (c) *limiting requirements for remediation to the work necessary to prevent unacceptable risks to human health or the environment in relation to the current use or future use of the land for which planning permission is being sought - in other words, recognising that the risks from contaminated land can be satisfactorily assessed only in the context of specific uses of the land (whether current or proposed), and that any attempt to guess what might be needed at some time in the future for other uses is likely to result either in premature work (thereby running the risk of distorting social, economic and environmental priorities) or in unnecessary work (thereby wasting resources).*

The mere presence of contaminants does not therefore necessarily warrant action, and consideration must be given to the scale of risk involved for the use that the site has, and will have in the future.

### PRELIMINARY RISK ASSESSMENT

The work presented in this report has been carried out in general accordance with recognised best practice as detailed in guidance documents such as in Environment Agency's Land Contamination: Risk Management documents (draft 2019), and BS 10175. The particular rationale behind the risk assessments presented is given in this appendix.

Current practice recommends that the determination of potential liabilities that could arise from land contamination be carried out using the process of risk assessment, whereby "risk" is defined as:

- "(a) The probability, or frequency, or occurrence of a defined hazard; and  
(b) The magnitude (including the seriousness) of the consequences."*

The UK's approach to the assessment of environmental risk is set out in by the Department of the Environment Transport and the Regions (2000) publication "A Guide to Risk Assessment and Risk Management for Environmental Protection" (also called Greenleaves II). This established an iterative, systematic staged process which comprised:

- (a) Hazard identification;
- (b) Hazard assessment;
- (c) Risk estimation;
- (d) Risk evaluation;
- (e) Risk assessment;

At each stage during the development process, the above steps are repeated as more detailed information becomes available for the site.

For an environmental risk to be present, all three of the following elements must be present:

- Source/Contaminant: hazardous substance that has the potential to cause adverse impacts;
- Receptor: target that may be affected by contamination: examples include human occupants/users of site, water resources (rivers or groundwater), or structures;
- Pathway: a viable route whereby a hazardous substance may come into contact with the receptor.

The absence of one or more of each component (contaminant, pathway, receptor) would prevent a contaminant linkage being established and thus, no significant environmental risk.

The identification of potential contaminant linkages is based on a Conceptual Model of the site, which is subject to continual refinement as additional data become available. As part of a Preliminary Risk Assessment (Desk

Study and site walkover) a Preliminary Conceptual Site Model (PCSM) is formed. Based on the PCSM, potential contaminant linkages can be assessed. If the PCSM and hazard assessment indicate that a contaminant linkage is not of significance, then no further assessment or action is required for this linkage. For each significant and potential linkage, a risk assessment is carried out. The linkages which potentially pose significant risks may require a variety of responses ranging from immediate remedial action or risk management or, more commonly, further investigation and risk assessment. This next stage is termed a Phase 2 Ground Investigation and should provide additional data to allow refinement of the Conceptual Site Model and assess the level of risk from each contaminant linkage.

**Definition of Risk Assessment Terminology**

The criteria used for risk assessment are broadly based on those presented in DETR’s “A Guide to Risk Assessment and Risk Management for Environmental Protection” (2000). The severity of the risk is classified according to the criteria in Table B.1 below:

**Table B.1 Severity/Consequence of Risk**

<b>Severe</b>	Acute risks to human health. Catastrophic damage to buildings/property (e.g. by explosion). Direct pollution of sensitive water receptors or serious pollution of other controlled water (watercourses or groundwater) bodies.
<b>Medium</b>	Harm to human health from long-term exposure. Slight pollution of sensitive controlled waters (surface waters or aquifers) or pollution of other water bodies. Significant effects on sensitive ecosystems or species.
<b>Mild</b>	No significant harm to human health in either short or long term. No pollution of sensitive controlled waters, no more than slight pollution of non-sensitive waters. Significant damage to buildings or structures. Requirement for protective equipment during site works to mitigate health effects.
<b>Negligible</b>	Damage to non-sensitive ecosystems or species. Minor damage to buildings or structures. No harm or pollution of water.

The probability of the risk occurring is classified according to criteria given in Table B.2 below:

**Table B.2: Probability of Risk Occurring**

<b>High likelihood</b>	Contaminant linkage may be present, and risk is almost certain to occur in the long term, or there is evidence of harm to the receptor.
<b>Medium/Reasonably Foreseeable</b>	Contaminant linkage may be present, and it is probable that the risk will occur over the long term.
<b>Low/Unlikely</b>	Contaminant linkage may be present and there is a possibility of the risk occurring, although there is no certainty that it will do so.
<b>Negligible/ Not credible</b>	Contaminant linkage may be present but the circumstances under which harm would occur are improbable.

An overall evaluation of the level of risk is gained from a comparison of the severity and probability, as shown in Table B.3 below:

**Table B.3: Comparison of Severity and Probability**

		<b>Severity</b>			
		<b>Severe</b>	<b>Medium</b>	<b>Mild</b>	<b>Negligible</b>
<b>Probability</b>	<b>High likelihood</b>	Very High Risk	High Risk	Medium/Low Risk	Low Risk
	<b>Medium/Reasonably Foreseeable</b>	High Risk	Medium Risk	Low Risk	Near Zero

	<b>Low/Unlikely</b>	High/Medium Risk	Medium/Low Risk	Low Risk	Near Zero
	<b>Negligible/Not credible</b>	Medium/Low Risk	Low Risk	Low Risk	Near Zero

The various risk rankings provide guidance for recommended actions, whether this is:

AR - Action Required, remediation or mitigation or site investigation works required.

SIR - Site Investigation Required, further assessment is required.

NAR - No Action Required.

A description of the evaluated risk is as follows:

**Table B.4 Description of the Classified Risks and Likely Action Required**

<b>Evaluated Risk</b>	<b>Recommended Actions</b>
<b>Very High Risk</b>	AR: There is a high probability that severe harm could arise to a designated receptor from an identified hazard, OR there is evidence that severe harm to a designated receptor is currently happening. This risk, if realised, is likely to result in a substantial liability. Urgent investigation (if not undertaken already) and remediation are likely to be required.
<b>High Risk</b>	AR: Harm is likely to arise to a designated receptor from an identified hazard. Realisation of the risk is likely to present a substantial liability. Urgent investigation (if not undertaken already) is required and remedial works may be necessary in the short term and are likely over the long term.
<b>Moderate Risk</b>	SI: It is possible that harm could arise to a designated receptor from an identified hazard. However, it is relatively unlikely that any such harm would be severe, or if any harm were to occur it is more likely that the harm would be relatively mild. Investigation (if not already undertaken) is normally required to clarify the risk and to determine the potential liability. Some remedial works may be required in the longer term.
<b>Low Risk</b>	NAR: It is possible that harm could arise to a designated receptor from an identified hazard, but there is a low likelihood of this hazard occurring and if realised, harm would at worst normally be mild.
<b>Near Zero</b>	NAR: There is a negligible possibility that harm could arise to a receptor. In the event of such harm being realised, it is not likely to be severe.

**Appendix C**  
**Site Photographs**

Photograph 1: The building on-site – its eastern side.

Photograph 2: The entrance to the right hand / northern unit, which was in use for storage.

Photograph 3: Inside the storage unit. The insulating board acted as a partition wall between the two units.

Photograph 4: Entrance to the left hand / southern unit, which was in use for the storage of fruit and vegetables.

Photograph 5: The southern end of the unit, together with an access track.

Photograph 6: The rear / western elevation of the building on-site.

Photograph 7: The rear / western elevation of the building on-site and track.

Photograph 8: The area to the north of the site.

Photograph 9: The area to the south of the site.

Photograph 10: The site and the area to the north.

Photograph 11: The area to the north of the site, which has recently received planning permission for redevelopment to residential use.

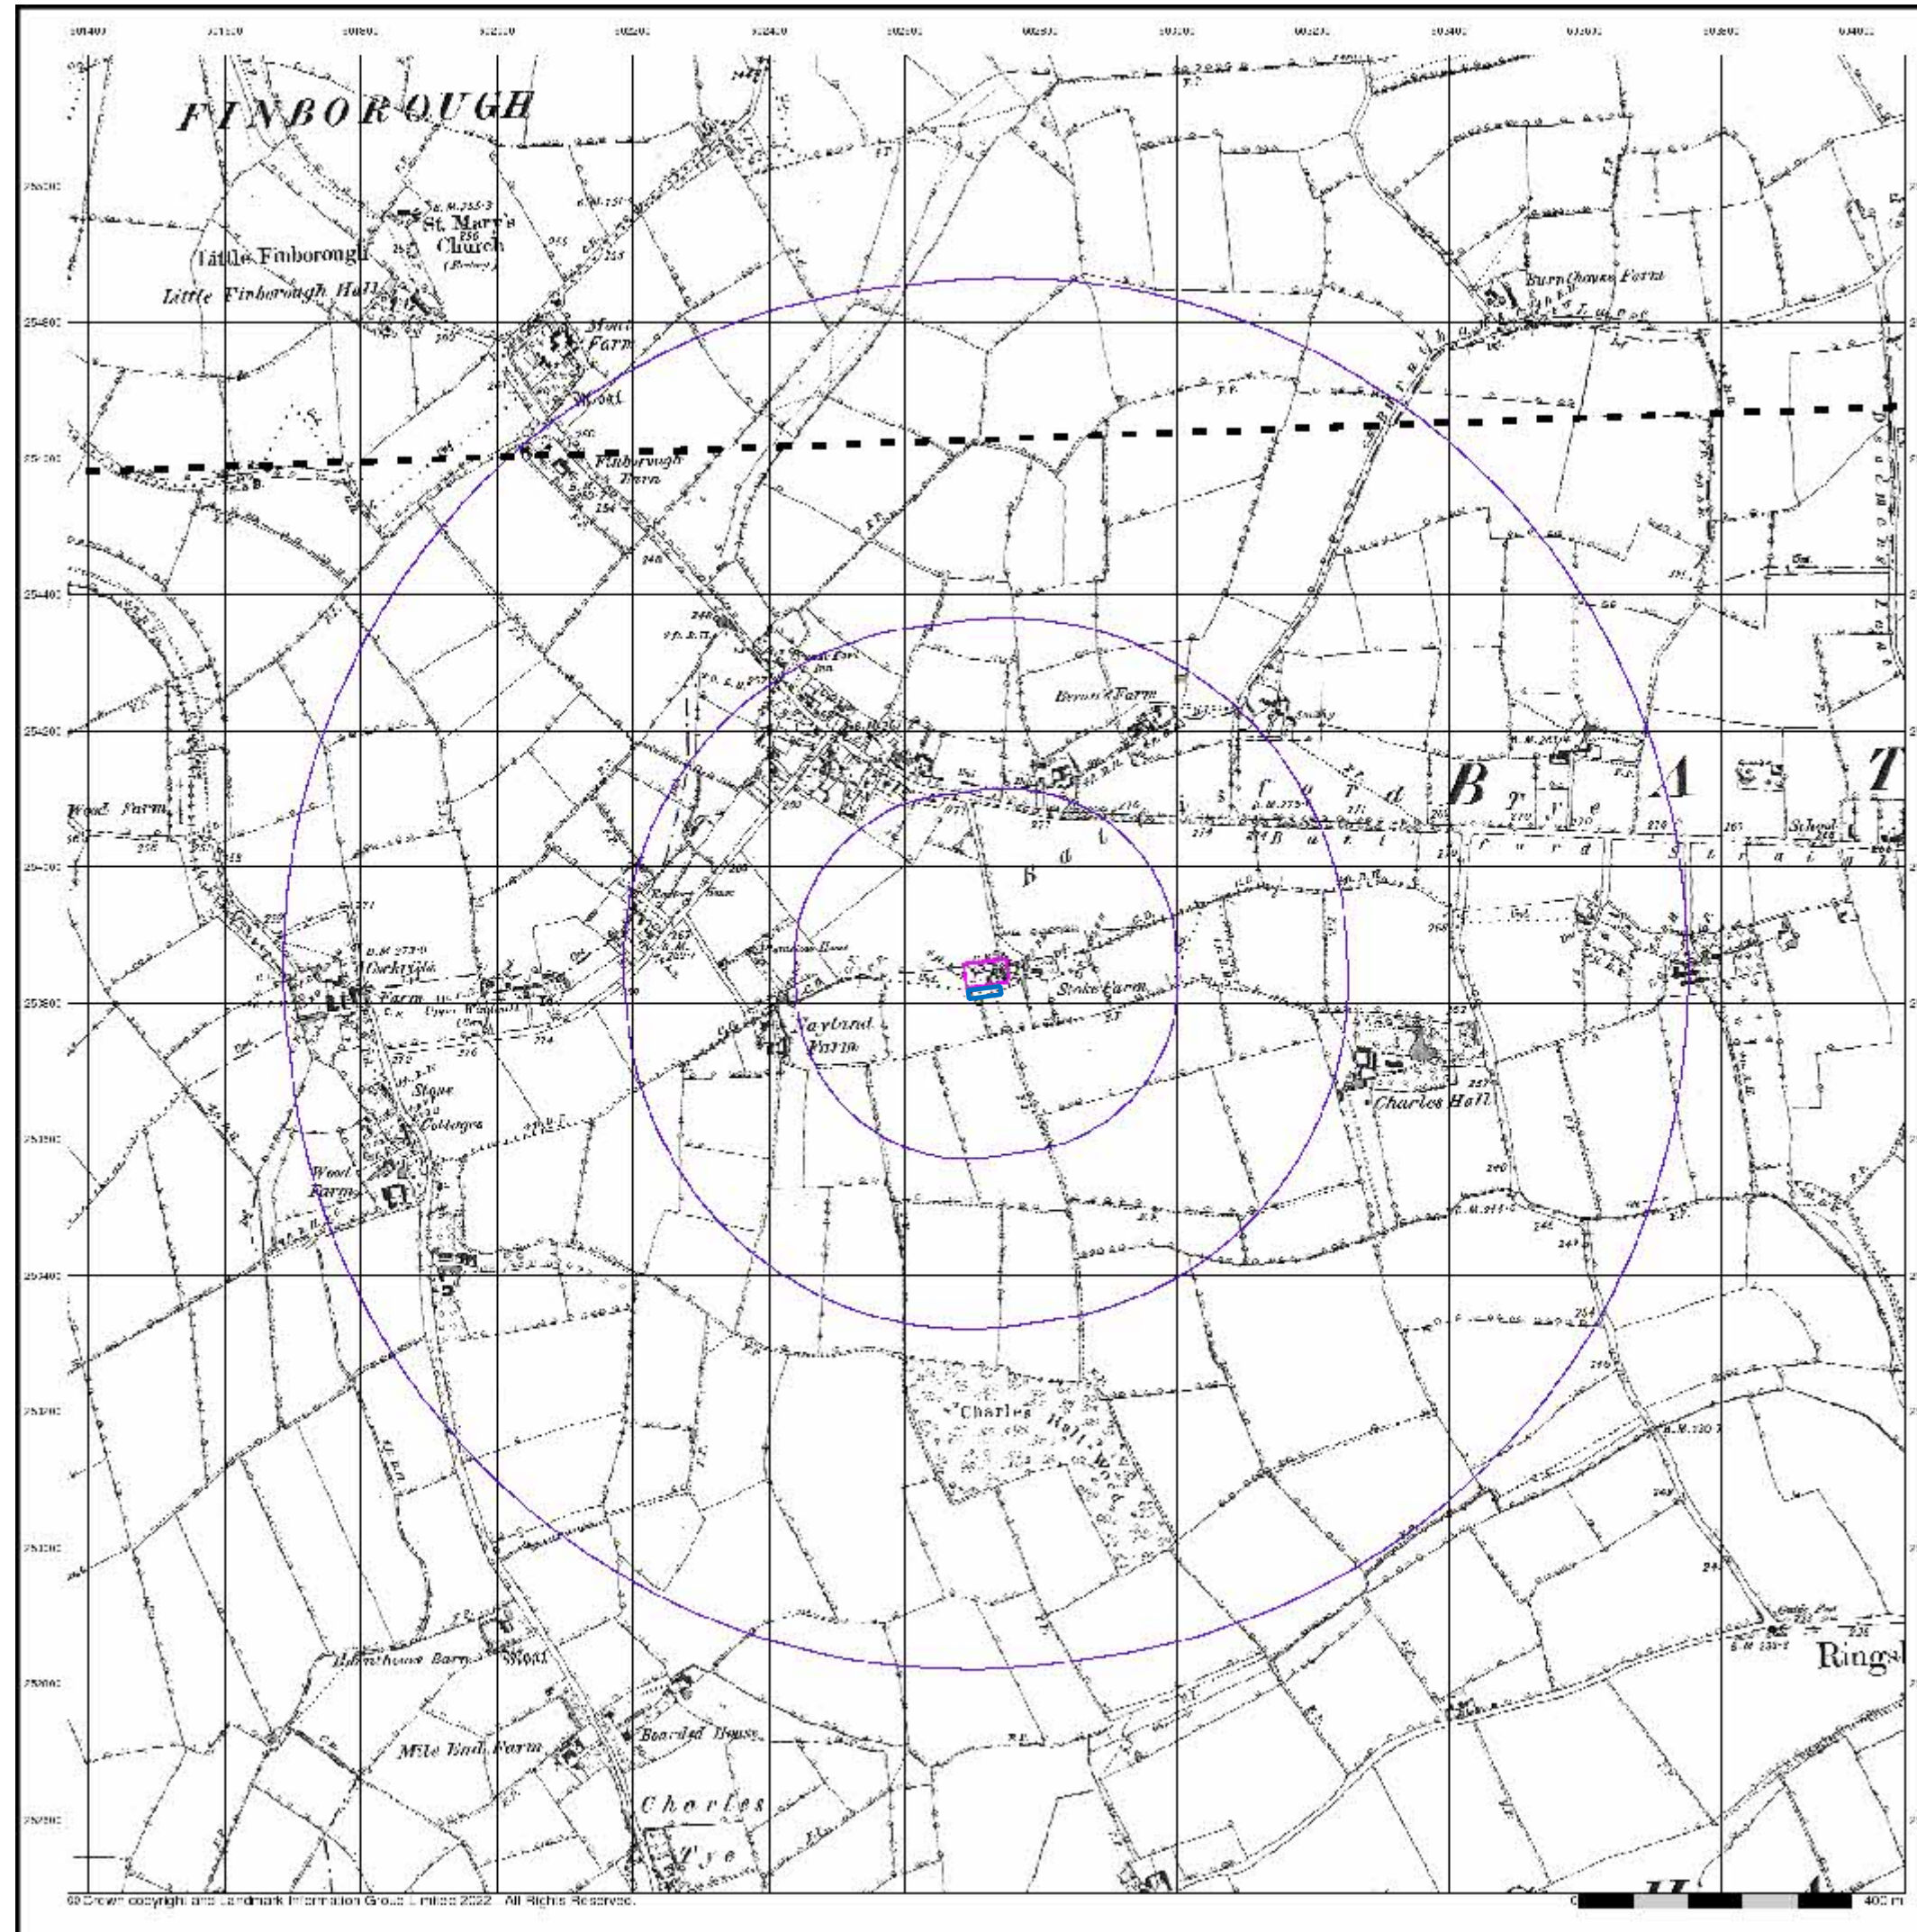

Photograph 12: The area to the north-east of the site and the access road from Straight Road further to the north..

## Ordnance Survey Plan

Published 1975

Source map scale - 1:2,500

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840's. In 1854 the 1:2,500 scale was adopted for mapping urban areas and by 1896 it covered the whole of what were considered to be the cultivated parts of Great Britain. The published date given below is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas.

## Ordnance Survey Plan Published 1980 Source map scale - 1:10,000

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840's. In 1854 the 1:2,500 scale was adopted for mapping urban areas; these maps were used to update the 1:10,560 maps. The published date given therefore is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas. In the late 1940's, a Provisional Edition was produced, which updated the 1:10,560 mapping from a number of sources. The maps appear unfinished - with all military camps and other strategic sites removed. These maps were initially overprinted with the National Grid. In 1970, the first 1:10,000 maps were produced using the Transverse Mercator Projection. The revision process continued until recently, with new editions appearing every 10 years or so for urban areas.

**10k Raster Mapping**  
**Published 2000**  
**Source map scale - 1:10,000**

The historical maps shown were produced from the Ordnance Survey's 1:10,000 colour raster mapping. These maps are derived from Landplan which replaced the old 1:10,000 maps originally published in 1970. The data is highly detailed showing buildings, fences and field boundaries as well as all roads, tracks and paths. Road names are also included together with the relevant road number and classification. Boundary information depiction includes county, unitary authority, district, civil parish and constituency.

### Introduction

The Environment Act 1995 has made site sensitivity a key issue, as the legislation pays as much attention to the pathways by which contamination could spread, and to the vulnerable targets of contamination, as it does the potential sources of contamination. For this reason, Landmark's Site Sensitivity maps and Datasheet(s) place great emphasis on statutory data provided by the Environment Agency/Natural Resources Wales and the Scottish Environment Protection Agency; it also incorporates data from Natural England (and the Scottish and Welsh equivalents) and Local Authorities; and highlights hydrogeological features required by environmental and geotechnical consultants. It does not include any information concerning past uses of land. The datasheet is produced by querying the Landmark database to a distance defined by the client from a site boundary provided by the client. In this datasheet the National Grid References (NGRs) are rounded to the nearest 10m in accordance with Landmark's agreements with a number of Data Suppliers.
