

Planting Specification

Wildflower seeding to be in accordance with BS.4428 (General Landscape Operations). Contractor to familiarize themselves with location of underground services using routing plans, CAT scans and onsite survey prior to planting and excavations.

Existing perennial weeds to be removed by hand prior to sowing wildflower seed. Minimal topsoil coverage to be used on areas to be seeded and managed for wildflowers and wild-grasses. Use thin layer of topsoil only to provide initial seed bed if required.

Maintenance of Species Rich Grassland and Meadows

Meadows should be cut once (late July - August) or twice (February) per year, to a minimum height of 10cm. The cuttings should be left for a couple of weeks to seed before being collected. The cuttings can either be piled in one corner of site to allow to decompose (these provide habitat for a range of species) or taken to a licenced site to be disposed of. A small patch of meadow each year could be left uncut to provide for wintering insects; this can be rotated each year.

KEY

- Existing Trees and Vegetation
 -  Existing Trees to Remain
- Proposed Meadow Grass and Wildflowers
 -  Meadow Grass and Wildflower Mix (Basic General Purpose Meadow Mixture), EM1 Grass and Wildflower Mix by Emorgate Seeds- or Similar)
