28th November 2023

Dear Sirs,

RE: 80 Granbrook Lane, Mickleton, GL55 6FT

I have recently been to the above property to inspect a self-seeded Ash tree in poor condition.

The tree is a mature Ash tree, situated by the drive to the front of the above property – photographs are shown below.

The tree has undergone heavy pollarding in the past and now has a short and weak trunk, due to an open split in the main trunk stem which is in a poor condition. Many trees in the immediate area are contaminated with Ash die-back and there is a significant expectation this tree will also be affected by the disease.

Due to the poor condition of the tree and prevalence of the disease in the area, I recommend that the tree is felled to ground level, and the stump is ground-out.

The tree is also causing damage to and lifting the drive at the front of the house, and the roots are also close to the main property drain with risk of potential damage.

We also recommend that the tree is felled to prevent further damage caused to the drive and drains.

Please contact me if you require any further information.

Yours faithfully,

Tom Negus
