## 1.0 Introduction

This document has been prepared by Vale Consultancy. on behalf of the client; Mr Tony Carrafa. The following list of native species plants have been selected as appropriate for use within the scheme rain gardens and attenuation basin because of their resilience within the intended environment, ease of maintenance, and which will also contribute towards local biodiversity.

## 2.0 Planting Schedule

The use of planting native species within bioretention areas and attenuation basins can help to provide a new quality habitat for wildlife, having a positive contribution to biodiversity in the area. Bioretention areas and attenuation basins primarily manage surface water runoff water quality and provide runoff interception for small rainfall events. The use of planted native species can support local biodiversity by providing habitat and food for invertebrates and birds.

The following list of plants have been selected as appropriate for use within the proposed rain garden and infiltration basin areas.

### 2.1 Retention Basin
