Property Boundary	Recorded Lode (Surface)	Recorded Shaft	Surface Workings	Elvan
Land Registry Boundaries	Suspected Lode (Surface)	Suspected Shaft	Mine Waste	Adit/Tunnel
Building	Lode at Other Elevation	Indicated Shaft (Doubtful)	Alluvium/Tin Streaming	Adit Portal
Former Structure	Geological Fault	Subsidence	Quarry	Well/Spring

OPINION

We believe that the property could be affected by subsidence related to historic metalliferous mining and we are unable to confirm or dismiss this without further assessment. A Property Inspection should be undertaken by a mining consultant to ensure the absence of mining subsidence related defects. A clear Property Inspection report will enable the property to be reclassified as suitable for conveyance. Should any part of the property be developed in the future, it is recommended that a mining consultant inspects the foundation excavations to ensure the absence of potentially adverse ground conditions and to provide final assurances before construction.

ABOUT

This Mining Search appraises the likelihood that mining subsidence hazards exist within the property. The report findings are based on factual information from maps, plans and records in our unique archive, the results of relevant on-site investigations, as well as commercially available datasets. This information has been interpreted by our experts to predict, where possible, the existence and location of unrecorded mine workings and related subsidence hazards.

THE FINDINGS

The property is situated within an area of extensive historic metalliferous mining activity.

Our records indicate that two mineral lodes (deposits) and an area of alluvial tin streaming lies within the property. These features are recorded on a nineteenth century mining map and inferred from information on an old Ordnance Survey map.

Unrecorded mine workings may exist on lode outcrops and these can cause subsidence problems.

Historic tin streaming results in disturbed sediments and buried infrastructure that can give rise to differential settlement unless accounted for in foundation design.

Several geological faults pass through the property. These features are unlikely to be directly associated with metallic mineralisation, however, an adit (shallow drainage tunnel) or an exploratory tunnel may have been driven on these features.

The property lies within a mineral planning permission area for the extraction of metalliferous minerals. We do not believe mineral extraction is currently taking place, but are unaware of future plans. Further information can be obtained from the mineral operator or Local Planning Authority, if required.

THE RESULT

Based on a detailed search and expert interpretation of our mining records archive we believe the likelihood that metalliferous mining subsidence hazards exist within the property is:

Result: Moderate ACTION REQUIRED

[FIND OUT MORE](#)

We believe that the property could be affected by subsidence related to historic metalliferous mining and we are unable to confirm or dismiss this without further assessment.

THE NEXT STEPS

To further assess the risks to this property we recommend the following course of action:

Next steps: SITE INSPECTION

[ORDER ONLINE](#)

A Property Inspection should be undertaken by a mining consultant to ensure the absence of mining subsidence related defects. A clear Property Inspection report will enable the property to be reclassified as suitable for conveyance. Should any part of the property be developed in the future, it is recommended that a mining consultant inspects the foundation excavations to ensure the absence of potentially adverse ground conditions and to provide final assurances before construction.

GEOLOGY

Metallic mineralisation in the South West mainly occurs in lodes (veins), which are sheet-like structures occupying former fissures in the bedrock. Lodes are typically about 1 metre (m) wide but some reach 5m or more and are either vertical or inclined at steep angles. Mineral lodes containing tin, copper and other metalliferous minerals typically course in an east-northeast to west-southwest direction, while those containing lead and silver often course approximately north to south. Localised variations can occur, and lodes are also affected by other geological structures, such as crosscourses (geological faults) and elvan dykes (wide, planar igneous intrusions that are occasionally mineralised).

MINING METHODS & HISTORY

The extraction of metalliferous minerals in the South West has taken place for thousands of years, throughout which shallow prospecting was widespread. This involved excavating costean (trial) pits in order to discover mineral lodes, often in areas where earlier tin-streaming had taken place. Once discovered, lodes were often mined by openworks (linear excavations) along the lode outcrop and later by means of shafts, adits (drainage tunnels) and levels (tunnels) driven away from the shafts. The ore was extracted from between the levels to leave stopes (narrow chasms). By the 19th century steam pumping engines enabled the workings to be deepened. During the tin and copper mining heyday, in the 18th and 19th centuries, the South West was one of the most productive mining regions in the world with over 2000 active mines. Thousands of shafts were sunk, and hundreds of miles of underground workings were driven along the lodes. However, by the end of the 19th century, the discovery of larger mineral deposits elsewhere led to the industrial decline in the South West and the closure of most mines. A lack of funds and regulations meant that mine workings were often left abandoned without being secured.

MINING ARCHIVE & UNRECORDED WORKINGS

The surviving officially deposited abandoned mine plans of most mines in the South West do not show the full extent of the underground workings, especially at shallow depth. It did not become a legal requirement for metal mines to keep comprehensive plans of the underground workings, and to deposit these upon abandonment until 1872. This law did not apply to mines that employed fewer than 12 people underground and neither did it require mines to survey any unused older workings. As a result, most of the old and shallow workings and smaller mines remain poorly recorded. We use a vast archive of other mining and geological records, maps, plans, books and datasets, along with our knowledge of the geology and mining methods to predict where workings could exist and might present a risk.

SUBSIDENCE RISKS

Any near-surface mine working that has not been properly secured poses a potential subsidence risk at surface. Mine shafts present a high risk of localised subsidence. Often these features were capped with timber when mining ceased and all evidence of them became obliterated. Shallow adits can collapse or cause flooding and mine waste tips/dumps can cause differential settlement. However, one of the main causes of mining related subsidence is the collapse of near-surface mine workings on lode outcrops. These workings, in the form of small pits, openworks or shallow stopes, were often backfilled with unconsolidated waste rock and are not evident at surface until they collapse, thereby presenting a high risk of subsidence. There is no legal imperative to report subsidence to a central body and so no comprehensive database of historic subsidence events exists. Therefore, it is not possible to conclude comprehensively whether a property has previously been affected; but we include comment on subsidence at a property if we are aware of it.

MORE INFORMATION

LIMITATIONS OF MINING SEARCH

This Mining Search evaluates the subsidence risk from the extraction of metalliferous minerals only. It cannot be relied upon to indicate risk from clay, stone, coal, oil or other non-metalliferous extraction. It has been produced following a search and review of the extensive collection of abandoned mine plans, maps, records and archives in our possession and from this material we have endeavoured to provide as accurate a report as possible. However, considering that such records may not be wholly complete or accurate, we cannot accept liability for any inaccuracies or omissions with respect to those records. This Mining Search does not include an assessment of soil contamination risks. This report and any mining features described are applicable to the subject property only, the location or boundaries of which have been approved by the client in instructing and receiving this report. We cannot be liable for any erroneous or omitted information as portrayed on any plan or property boundary supplied to us for this Mining Search. The report must not be relied upon for neighbouring properties, as any adjacent mining features may have been omitted for clarity. This report is confidential to the client, client's solicitor and/or mortgage lender or those acting through a conveyance service provider (as per the quoted reference number) and may not be reproduced or further distributed, re-sold or reassigned without our permission. We shall be under no liability whatsoever to any person who has not been party to the commissioning and fee paid for this report or any undisclosed third party. We have not visited the property.

IMPORTANT CONSUMER PROTECTION INFORMATION

This search has been produced by Cornwall Consultants Ltd trading as Cornwall Mining Consultants, Unit 3 East Pool, Tolvaddon Business Park, Camborne TR14 0HX. Tel: (01209) 313511. Email: enquiries@cornwallminingconsultants.co.uk, which is registered with the Property Codes Compliance Board (PCCB) as a subscriber to the Search Code. The PCCB independently monitors how registered search firms maintain compliance with the Code. This search has been completed in accordance with our Terms and Conditions of business that can be viewed [here](#).

RESULT CLASSIFICATIONS FOR MORTGAGE

This regulated Mining Search report does not comment on the value or mortgage-ability of any specific property; however, guidance on the implications of results is as follows:

PASSED

Acceptable for conveyance and typically acceptable to mortgage lenders.

ACTION REQUIRED

The likelihood that mining subsidence hazards exist within the property is moderate. Value, enjoyment may be affected, and the advised further action should be satisfied before conveyance proceeds.

ACTION REQUIRED

The likelihood that mining subsidence hazards exist within the property is high. The value, enjoyment and security of the property may be affected. The advised further action should be completed, and a satisfactory result attained before mortgage or transaction proceeds.

ABOUT THE SEARCH CODE AND COMPLAINTS

THE SEARCH CODE

- Provides protection for homebuyers, sellers, estate agents, conveyancers and mortgage lenders who rely on the information included in property search reports undertaken by subscribers on residential and commercial property within the United Kingdom
- Sets out minimum standards which firms compiling and selling search reports have to meet
- Promotes the best practice and quality standards within the industry for the benefit of consumers and property professionals
- Enables consumers and property professionals to have confidence in firms which subscribe to the code, their products and services.

By giving you this information, the search firm is confirming that they keep to the principles of the Code. This provides important protection for you.

Firms which subscribe to the Search Code will:

Display the Search Code logo prominently on their search reports act with integrity and carry out work with due skill, care and diligence at all times maintain adequate and appropriate insurance to protect consumers conduct business in an honest, fair and professional manner handle complaints speedily and fairly ensure that products and services comply with industry registration rules and standards and relevant laws monitor their compliance with the Code

COMPLAINTS

If you have a query or complaint about your search, you should raise it directly with the search firm, and if appropriate ask for any complaint to be considered under their formal internal complaints procedure. If you remain dissatisfied with the firm's final response, after your complaint has been formally considered, or if the firm has exceeded the response timescales, you may refer your complaint for consideration under The Property Ombudsman scheme (TPOs). The Ombudsman can award up to £5,000 to you if the Ombudsman finds that you have suffered actual financial loss and/or aggravation, distress or inconvenience as a result of your search provider failing to keep to the Code.

Please note that all queries or complaints regarding your search should be directed to your search provider in the first instance, not to TPOs or to the PCCB.

Contact Cornwall Mining Consultants if you would like a copy of the Search Code or our Complaints Procedure. We trust this report provides the information you require, however should you have any queries, please contact Cornwall Mining Consultants.

TPOS CONTACT DETAILS

COMPLAINTS PROCEDURE

Cornwall Consultants Ltd trading as Cornwall Mining Consultants is registered with the Property Codes Compliance Board as a subscriber to the Search Code. A key commitment under the Code is that firms will handle any complaints both speedily and fairly.

If you wish to make a complaint directly to Cornwall Mining Consultants, we will:

- Acknowledge it within 5 working days of receipt.
- Normally deal with it fully and provide a final response, in writing, within 20 working days of receipt.
- Keep you informed by letter, telephone or e-mail, as you prefer, if we need more time.
- Provide a final response, in writing, at the latest within 40 working days of receipt.
- Liaise, at your request, with anyone acting formally on your behalf.

If you are not satisfied with our final response, or if we exceed the response timescales, you may refer the complaint to:

The Property Ombudsman scheme (TPOs):

T: 01722 333306 | **E:** admin@tpos.co.uk | **W:** tpos.co.uk

We will co-operate fully with the Ombudsman during an investigation and comply with his final decision.

COMPLAINTS SHOULD BE SENT TO:

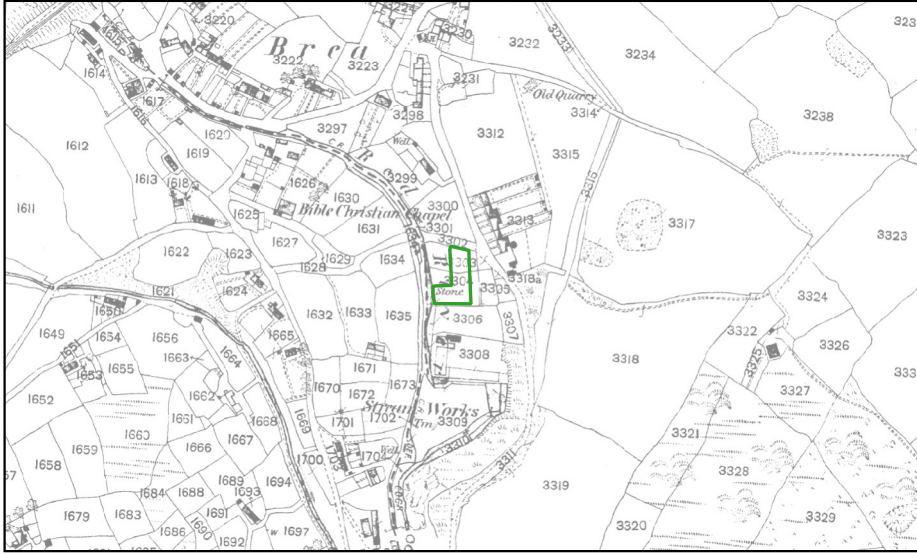

The Managing Director
Cornwall Mining Consultants
Unit 3 East Pool
Tolvaddon Business Park
Camborne
Cornwall
TR14 0HX

E: help@cornwallminingconsultants.co.uk | **T:** 01209 313511

Introduction

The Environment Act 1995 has made site sensitivity a key issue, as the legislation pays as much attention to the pathways by which contamination could spread, and to the vulnerable targets of contamination, as it does the potential sources of contamination. For this reason, Landmark's Site Sensitivity maps and Datasheet(s) place great emphasis on statutory data provided by the Environment Agency/Natural Resources Wales and the Scottish Environment Protection Agency; it also incorporates data from Natural England (and the Scottish and Welsh equivalents) and Local Authorities; and highlights hydrogeological features required by environmental and geotechnical consultants. It does not include any information concerning past uses of land. The datasheet is produced by querying the Landmark database to a distance defined by the client from a site boundary provided by the client. In this datasheet the National Grid References (NGRs) are rounded to the nearest 10m in accordance with Landmark's agreements with a number of Data Suppliers.

APPENDIX F: Risk Categorisation

[NHBC - Guidance for the Safe Development of Housing on Land Affected by Contamination \(2008\) Chapter 1.7](#)

Risk assessment is the process of collating known information on a hazard or set of hazards in order to estimate actual or potential risks to receptors. The guiding principle behind this approach is an attempt to establish connecting links between a hazardous source, via an exposure pathway to a potential receptor, referred to as a 'pollutant linkage'. The objective of a Preliminary Risk Assessment is to identify the nature and magnitude of the potential risks. This involves consideration of:

- each potential pollutant linkage (contaminant source – pathway – receptor);
- current status of the site, construction activity, proposed new use etc.;
- short-term (acute) and long-term (chronic) risks; and
- uncertainty (does enough data exist to provide confidence in the assessment?).

This approach is in accordance with the Statutory Guidance on Contaminated Land (Defra 2006a, WAG 2006a and Scottish Executive 2006a) and the Model Procedures (Defra/Environment Agency 2004a).

Risk is based on a consideration of both:

- **the likelihood of an event** (probability) [takes into account both the presence of the hazard and receptor and the integrity of the pathway];
- and **the severity of the potential consequence** [takes into account both the potential severity of the hazard and the sensitivity of the receptor].

A pollutant linkage must first be established before tests for probability and consequence are applied. If there is no pollutant linkage then there is no potential risk.

There is a need for a logical, transparent and repeatable system in defining the categories of severity of consequence and likelihood as well as for the risk itself.

Severity (consequence) can be defined as the adverse effects (or harm) arising from a defined hazard, which impairs the quality of human health or the environment in the short or longer term. For example a consequence defined as "Severe" could be defined as "Highly elevated concentrations likely to result in 'significant harm' to human health as defined by the EPA 1990, Part 2A, if exposure occurs". The type and form of the contaminant needs to be known in order to understand the effect on humans and therefore severity of potential harm. For instance different forms of cyanide behave differently. Complex cyanide ("blue billy") is relatively "non toxic" whereas free cyanide is "highly toxic" (Environment Agency 2002b).

Probability can be defined as the chance of a particular event occurring in a given period of time. For example, a "High Likelihood" could be defined as "where an event would appear very likely in the short-term and almost inevitable over the long-term, or there is evidence at the receptor of harm or pollution".

Risk classification

Once the consequence and probability have been classified for a pollutant linkage they can be compared to produce a risk category from "very high risk" to "very low risk". It is not possible to identify a risk rating of "no risk" as the acceptability of risk may depend on the viewpoint of the stakeholder concerned. It may be necessary to deal with a risk even if it is "very low" although this action may not be urgent. The following classification of risk has been developed to assist in qualitative assessment of potentially unacceptable risks:

RISK CATEGORISATION					
PROBABILITY (LIKELIHOOD)		CONSEQUENCE			
		Severe	Medium	Mild	Minor
	High Likelihood	Very High Risk	High Risk	Moderate Risk	Low Risk
	Likely	High Risk	Moderate Risk	Moderate/Low Risk	Low Risk
	Low Likelihood	Moderate Risk	Moderate/Low Risk	Low Risk	Very Low Risk
Unlikely	Moderate/Low Risk	Low Risk	Very Low Risk	Very Low Risk	

DESCRIPTION OF RISK	
Very High Risk	There is a high probability that severe harm could arise to a designated receptor from an identified hazard at the site without appropriate remediation action.
High Risk	Harm is likely to arise to a designated receptor from an identified hazard at the site without appropriate remediation action.
Moderate Risk	It is possible that without appropriate remediation action harm could arise to a designated receptor. It is relatively unlikely that any such harm would be severe, and if any harm were to occur it is more likely that such harm would be relatively mild.
Low Risk	It is possible that harm could arise to a designated receptor from an identified hazard. It is likely that, at worst if any harm was realised any effects would be mild.
Very Low Risk	The presence of an identified hazard does not give rise to the potential to cause harm to a designated receptor.
