

Surface Water Drainage Details

The existing foul and surface water is disposed of in the combined system which runs along the side of the property towards the front.

There will be a new flat roof which will link into the existing combined drainage system. Apart from a larger flat roof there will be no additional surface water drains or any alterations to the existing foul water drains.

The new extension will be built close to one of the existing manhole covers and a South West Water Build-over notice will be applied for if successful.
