scale 1:50 on A1

Brick edge for path

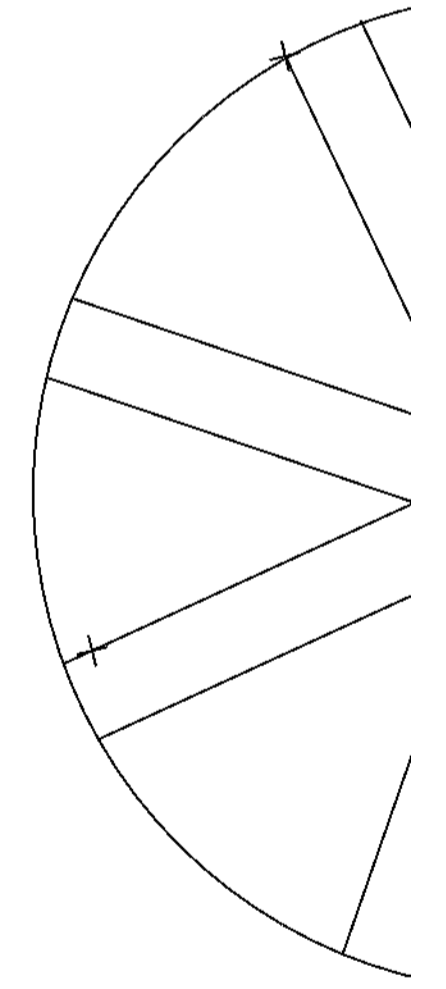

Permeable paving, example

Notes

- Planting**  
Detailed planting plan on request
- BRANCH REMOVAL:**  
Cut branches sufficiently far from the main stem to leave the branch bark ridge intact. Avoid moisture traps and horizontal surfaces. Remove heavy branches in sections. Remove dead or damaged wood whether or not specifically listed.
- C625 LIFTING THE CROWN:**  
Remove branches from the main trunk or from main vertical branches so that the space below the canopy is clear up to the specified height.
- C630 REDUCING, THINNING AND SHAPING:**  
Carefully select and remove branches and prune subsidiary branches so that the height and/or spread are reduced or the crown thinned to the specified dimensions or percentages without destroying the shape and character of the individual tree or the species.
- New low hedging to be at 600mm height, 10L container
- New planting to be in consideration of surrounding, native species where possible to attract wildlife and enhance biodiversity
- Wildflower meadow to be native species where possible
- Two Birdboxes to be installed on standard trees in undisturbed area of the garden  
One Stag beetle loggers to be created in a semi shaded and sheltered position, using felled trees from the site if possible. Bury logs at least 50cm below ground to prevent drying out
- Drainage management, see plan by others
