## **1.0 Introduction**

GGP Consult has been instructed by H. Linford to prepare a drainage impact assessment for the proposed residential living development on land to the rear of 132 Scarborough Road, Bridlington, East Yorkshire.

The following assessment will detail how the proposed development will drain surface and foul water from the site with consideration to the National Planning Policy Framework (NPPF).

## **2.0 Description of Existing Site**

The site is located within Bridlington. The site is on the boundary of a residential developments & local fields.

The site has an area of 2,995m<sup>2</sup> and is partially impermeable with 2 existing building located within the boundary as well as a concrete road leading off from Scarborough Road. The site is understood that the site is currently occupied due to the existing buildings being 'garages' for neighbouring residents. The site is bound to the north & east by Local Fields, to the west & south by residential dwellings.

Approximately, the grid reference for the site is TA 17142 68490.

Refer to Appendix I for the Existing Site Location Plan.

Refer to Appendix II for the Existing Impermeable Area.

The site has an average existing level of 34.000m.

## **2.1 Description of Existing Site Drainage**

The existing site is understood to be partially positively drained; however, the true extent of the existing drainage system is currently unknown.

It is understood that the concrete road serving the two separate garages and their associated roofs are positively drained down the concrete road into the existing systems within Scarborough Road.

Note – This is to be confirmed prior to construction allowing a full understanding of the existing system to be clarified.

Additionally, a Yorkshire Water Combined & Surface water systems are located to the southwest of the site within Scarborough Road.

## **3.0 Proposed Site**

It is proposed to develop a Residential Living Development concluding of 4 houses. This is to be accompanied by a car park on the scheme, 2 bays per development.

The living complex will have a FFL of 33.700m AOD.

As the site doesn't comprises more than 10 dwellings, is greater than 0.5ha of developable area and has over 0.1ha in floor area, it is classified as a major development and the Lead Local Flood Authority are not required to be consulted as part of the planning process unless otherwise stated.

#### **4.0 Design Philosophy**

Part H of the Building Regulations details a preferred hierarchy for surface water disposal. Consideration should firstly be given to discharge to infiltration system, watercourse, surface water sewer & combined sewer in that priority order.

Ground investigation is to be carried out on the development, so a full understanding of the ground conditions is understood prior to construction. It is noted that the client is to undertake BRE 365 testing allowing the use of infiltration on the scheme to be investigated. Allowing this preferred option to be used or signed off as unacceptable.

The closest watercourse is located 1km to the south of the site; this has been identified as a Dyke/Ditch which runs through the town of Bridlington, which has been deemed as an unfeasible connection.

As the connection into the Dyke/Ditch located to the south of the site is unfeasible, it is proposed that the drainage system be discharged into the combined / surface water system within Scarborough Road, this is to be done through a proposed a split Foul and Surface water system. Surface water will leading into the existing 225mm Existing Yorkshire water system located within Scarborough Road. Therefore the Foul water will flow into the 200mm Combined Drain within Scarborough Road.

**Therefore, it is proposed to discharge into the existing Yorkshire Water Surface/Combined water systems**

#### **5.0 Proposed Site Drainage**

As mentioned within section 4.0, it is proposed to discharge into the existing Yorkshire Water surface water system within Scarborough Road (pending approval from Yorkshire Water).

It is proposed to discharge through a HydroBrake from the development at a rate of 3.5l/s.

In accordance with local drainage standards, a 40% climate change allowance will be applied to the calculations.

The existing site has an impermeable area of 2,995m<sup>2</sup> and is discharged at an unrestricted rate, note that the following discharge route is not yet finalised and fully understood, further surveys will be undertaken to understand the flow direction.

Surface water from the development is to be collected by a series of chambers, gullies and pipes where it will be brought into the landscaped area and discharged into a cellular storage system.

Surface water runoff from the hardstanding road will be collected by several gullies located in the road and discharged into a Klargestor NSBP003 Bypass Separator before discharging into the proposed attenuation tank.

A Wavin AquaCell Core-R cellular storage system is to be used. This will be designed to contain 77.4m<sup>3</sup> of runoff at 95% voids. This has been designed to contain the 1:100 year + 40% CC below ground. Refer to section 6.0 for calculation details.

The tank will discharge into a Hydro-Brake flow control chamber located to the south of the tank where the site runoff will be restricted to 3.5l/s. This is to have a design head of 0.800m AOD and to be fitted with a catchpit.

This is to discharge into a proposed surface water manhole within the site. A manhole connection will be formed into the existing 225Ø Yorkshire Water Surface Sewer located within Scarborough Road.

Refer to Appendix III for the Proposed Surface Water Drainage Layout.

Foul water from the development is to be collected through a series of soil vent pipes, sewers and manhole chambers. This will be brought to the southwest of the site where it will discharge into the proposed combined manhole located within the site. Discharging into the existing 200mm existing sewer located to the west of the development. A manhole connection will be required for this.

Refer to Appendix VI for the Proposed Foul Water Drainage Layout.

## 6.0 Point of Discharge

### 6.1 Interception Storage

- a) Preliminary calculations have been undertaken in accordance with “SUDS Manual 2015, Section 24.8, simple approaches to interception delivery and compliance assessment”.

The proposed site does not incorporate rainwater harvesting, infiltration, permeable paving, or other suitable SUDS components.

### 6.2 Water Quality

Define pollution hazard indices – see below tables

Land use	Pollution hazard level	Requirements for discharge to surface waters, including coasts and estuaries <sup>2</sup>	Requirements for discharge to groundwater
Residential roofs	Very low	Removal of gross solids and sediments only	
Individual property driveways, roofs (excluding residential), residential car parks, low traffic roads (eg cul de sacs, home zones, general access roads), non-residential car parking with infrequent change (eg schools, offices)	Low	Simple index approach <sup>3</sup> Note: extra measures may be required for discharges to protected resources <sup>4</sup>	
Commercial yard and delivery areas, non-residential car parking with frequent change (eg hospitals, retail), all roads except low traffic roads and trunk roads/motorways	Medium	Simple index approach <sup>3</sup> Note: extra measures may be required for discharges to protected resources <sup>4</sup>	Simple index approach <sup>3</sup> Note: extra measures may be required for discharges to protected resources <sup>4</sup> In England and Wales, Risk Screening <sup>5</sup> must be undertaken first to determine whether consultation with the environmental regulator is required. In Northern Ireland, the need for risk screening should be agreed with the environmental regulator.
Trunk roads and motorways	High	Follow the guidance and risk assessment process set out in HA (2009)	
Sites with heavy pollution (eg haulage yards, lorry parks, highly frequented lorry approaches to industrial estates, waste sites), sites where chemicals and fuels (other than domestic fuel oil) are to be delivered, handled, stored, used or manufactured, industrial sites	High	Discharges may require an environmental licence or permit <sup>6</sup> . Obtain pre-permitting advice from the environmental regulator. Risk assessment is likely to be required <sup>6</sup> .	

Pollution Hazard Level is 'Low'.

**TABLE 26.2 Pollution hazard indices for different land use classifications**

Land use	Pollution hazard level	Total suspended solids (TSS)	Metals	Hydrocarbons
Residential roofs	Very low	0.2	0.2	0.05
Other roofs (typically commercial/ industrial roofs)	Low	0.3	0.2 (up to 0.8 where there is potential for metals to leach from the roof)	0.05
Individual property driveways, residential car parks, low traffic roads (eg cul de sacs, homezones and general access roads) and non-residential car parking with infrequent change (eg schools, offices) ie < 300 traffic movements/day	Low	0.5	0.4	0.4
Commercial yard and delivery areas, non-residential car parking with frequent change (eg hospitals, retail), all roads except low traffic roads and trunk roads/motorways <sup>1</sup>	Medium	0.7	0.6	0.7
Sites with heavy pollution (eg haulage yards, lorry parks, highly frequented lorry approaches to industrial estates, waste sites), sites where chemicals and fuels (other than domestic fuel oil) are to be delivered, handled, stored, used or manufactured; industrial sites; trunk roads and motorways <sup>2</sup>	High	0.8 <sup>3</sup>	0.8 <sup>3</sup>	0.9 <sup>3</sup>

Pollution Hazard Level is 'Low'.

**TABLE 26.3 Indicative SuDS mitigation indices for discharges to surface waters**

Type of SuDS component	Mitigation indices <sup>1</sup>		
	TSS	Metals	Hydrocarbons
Filter strip	0.4	0.4	0.5
Filter drain	0.4 <sup>2</sup>	0.4	0.4
Swale	0.5	0.6	0.6
Bioretention system	0.8	0.8	0.8
Permeable pavement	0.7	0.6	0.7
Detention basin	0.5	0.5	0.6
Pond <sup>4</sup>	0.7 <sup>3</sup>	0.7	0.5
Wetland	0.8 <sup>3</sup>	0.8	0.8
Proprietary treatment systems <sup>4,5</sup>	These must demonstrate that they can address each of the contaminant types to acceptable levels for frequent events up to approximately the 1 in 1 year return period event, for inflow concentrations relevant to the contributing drainage area.		

*As the site hardstanding is over 800m<sup>2</sup>, mitigation measures are required. Therefore, the site will use a 'Proprietary treatment system'.*

### 6.3 Peak Flow Rate & Volume Control

#### 6.3.1 Brownfield Site

- a) As existing the site is entirely brownfield.

Catchment areas can be defined as follows,

##### Catchment Areas

##### Existing

Total Existing Impermeable Area	= 375m <sup>2</sup>
Total Existing Permeable Area	= 2,620m <sup>2</sup>
Total Site Area	= <b><u>2,995m<sup>2</sup></u></b>

##### Proposed

Proposed Impermeable Road Area	= 767m <sup>2</sup>
Proposed Impermeable Building Area	= 590m <sup>2</sup>
Proposed Impermeable Carpark Area	= 92m <sup>2</sup>
Proposed Impermeable Patio Area	= 231m <sup>2</sup>
Total Impermeable Area	= <b>1,680m<sup>2</sup></b>
Proposed Permeable Ground Area	= 1,315m <sup>2</sup>
Total Permeable Area	= <b>1,315m<sup>2</sup></b>

Refer to Appendix V for the Proposed Impermeable Area Layout

- b) The following MicroDrainage output are based on a Hydrobrake set to 3.5l/s at 0.800m Head and an attenuation volume of 77.4m<sup>3</sup>

Additional parameter within the model are;

Ground Level	= 33.700m AOD
Tank Invert Level	= 31.300m AOD
Area	= 100m <sup>2</sup>
Length	= 8.5m
Width	= 8m
Depth	= 1.2m
Void Ratio	= 0.95%
Total Impermeable Area	= 0.168ha

- c) The below table identifies the storage structure along with drain downtime for the 1:100 yr. 6hr event + 40% CC.

The below results are a summary taken from the MicroDrainage Model.

Structure Name	Cover Level	Max Water Level	Peak Discharge Rate (l/s)	Above Ground Flooding	Flooding Depth
SW Tank	33.700m AOD	32.016m AOD (360 Winter)	2.5l/s	0.0m <sup>3</sup>	0mm

See Appendix VI for full MicroDrainage calculations for the above.

- d) The below table identifies the storage structure along with drain downtime for the 1:1 yr. event + 40% CC.

The below results are a summary taken from the MicroDrainage Model.

Structure Name	Cover Level	Max Water Level	Peak Discharge Rate (l/s)	Above Ground Flooding	Flooding Depth
SW Tank	33.700m AOD	31.460m AOD (120 Winter)	3.5l/s	0.0m <sup>3</sup>	0mm

As shown above, all flows up to and including the 1:1-year storm event can be contained below ground. See Appendix VI for full MicroDrainage calculations for the above.

- e) The below table identifies the storage structure along with drain downtime for the 1:30 yr. event + 40% CC.

The below results are a summary taken from the MicroDrainage Model.

Structure Name	Cover Level	Max Water Level	Peak Discharge Rate (l/s)	Above Ground Flooding	Flooding Depth
SW Tank	33.700m AOD	31.849m AOD (180 Winter)	3.5l/s	0.0m <sup>3</sup>	0mm

As shown above, all flows up to and including the 1:30-year storm event can be contained below ground. See Appendix VII for full MicroDrainage calculations for the above.

- f) The below table identifies the storage structure along with drain downtime for the 1:100 yr. event + 40% CC.

The below results are a summary taken from the MicroDrainage Model.

Structure Name	Cover Level	Max Water Level	Peak Discharge Rate (l/s)	Above Ground Flooding	Flooding Depth
SW Tank	33.700m AOD	32.074m AOD (180 Winter)	3.5l/s	0.0m <sup>3</sup>	0mm

As shown above, no above-ground flooding occurs during the 1:100 year storm event +40 CC.

Refer to Appendix VI for full MicroDrainage calculations for the above.

As shown above, all flows up to and including the 1:100 year storm event +30% CC can be contained below ground.

## 7.0 Construction Design Elements

- a) All chambers discharging directly to attenuation structures should be preceded by a catchpit manhole to help remove sediment prior to discharge.
- b) Channel drains are to have sump units to help remove sediment prior to discharge.
- c) All SUDs structures are to be lined with an impermeable geomembrane due to local ground conditions

## 7.1 Water Quality Treatment

As shown on the Environment Agency map below, the site is located within 'Zone 1 – Inner Protection Zone'.

## 7.2 Functionality of the Design

- a) The client has full ownership on the land within the redline boundary. Along with the obligation to construct new access for the site.
- b) Pipework is to be maintained as per manufacturer's instructions.

## 8.0 Maintenance

Recommendations for inspection and maintenance can be seen in the table overleaf. It is worth noting that both the drainage and highway elements of the design will remain under the ownership of the landowner who will be solely responsible for the maintenance and upkeep of these elements of the proposal.

The landowner will perform a thorough site inspection biannually and as a minimum the following maintenance item should be actioned without fail.

- Lifting of manhole lids to check flows.
- Catchpits to be emptied.
- Rodding of external pipework.

Where defects exist, maintenance will be carried out in accordance with the below maintenance schedule. In addition to this a CCTV survey of the full drainage system will be undertaken every 5 years to check the condition of the pipework

ITEM	DEFECT CHECK	DETAILED INSPECTION VISUAL INSPECTION	ACTION REQUIRED	REPLACEMENT	ADDITIONAL COMMENTS
<b>FLOW CHECK</b>	Surface water ponding	6months. Lifting of manhole lids to check flows.	Check downstream for blockages. Clean system and undertake CCTV survey if issues are identified	N/A	Under the maintenance responsibility of the landowner.
<b>MANHOLE COVERS</b>	Broken lids.	6 months.	Replace.	When broken.	Under the maintenance responsibility of the landowner.
<b>MANHOLE</b>	Blockages, surcharging.	6months. Lifting of manhole lids to check flows.	Check downstream for blockages. Clean system and undertake CCTV survey if issues are identified	N/A	Under the maintenance responsibility of the landowner.
<b>INSPECTION CHAMBER</b>	Blockages, surcharging.	6months. Lifting of manhole lids to check flows.	Check downstream for blockages. Clean system and undertake CCTV survey if issues are identified	N/A	Under the maintenance responsibility of the landowner.
<b>SILT TRAPS/ CATCHPITS</b>	Blockages, slit build up	6months. Lifting of manhole to check for silt.	Empty and clean sump	N/A	Under the maintenance responsibility of the landowner.
<b>PIPEWORK</b>	Blockages, Cracking	6 months.	Rodding required	When damaged.	Under the maintenance responsibility of the landowner.
<b>GUTTERING</b>	Blockages	6 months.	Cleaning and removal of debris	N/A	Under the maintenance responsibility of the landowner.
<b>ACCESS ROAD</b>	Surface damage	6 months.	Pressure washing of surface  Surface Patching when required	When damaged.  (Surfacing to be patched to original specification.)	Under the maintenance responsibility of the landowner.
<b>GULLIES</b>	Blockages, silt removal	Yearly	Gullies to be inspected and emptied to reduce sediment entry to the tank.	N/A	Under the maintenance responsibility of the landowner.

## 9.0 Attenuation Summary

Within section 6.3.1, various storm periods have been modelled based on outline parameters. This has resulted in a required attenuation volume to satisfy the storm events up to and including the 1:100yr storm.

From the calculations undertaken, it has been established that 77.4m<sup>3</sup> of attenuation is required to be contained up to the 1:100yr event while maintaining a peak discharge rate no greater than 3.5l/s

## **APPENDIX I**

### Existing Site Location Plan

- NOTES:
1. All dimensions must be checked on site and not scaled from this drawing.
  2. The Contractor shall make a survey of the site and shall be responsible for obtaining all dimensions and levels necessary for the proper fabrication of the structure as indicated.
  3. All levels shown on this drawing are relative to Agreed Datum
  4. This drawing is to be read in conjunction with 30047/100 Series Drawings.
  5. All existing invert levels are to be confirmed by contractor prior to construction. Connection subject to approval.

Model Details

Storage is Online Cover Level (m) 33.700

Tank or Pond Structure

Invert Level (m) 31.300

Depth (m)	Area (m <sup>2</sup> )	Depth (m)	Area (m <sup>2</sup> )	Depth (m)	Area (m <sup>2</sup> )	Depth (m)	Area (m <sup>2</sup> )
0.000	100.0	1.200	100.0	1.201	1.0	2.400	1.0

Hydro-Brake® Optimum Outflow Control

Unit Reference MD-SHE-0092-3500-0800-3500  
 Design Head (m) 0.800  
 Design Flow (l/s) 3.5  
 Flush-Flo™ Calculated  
 Objective Minimise upstream storage  
 Application Surface  
 Sump Available Yes  
 Diameter (mm) 92  
 Invert Level (m) 31.250  
 Minimum Outlet Pipe Diameter (mm) 150  
 Suggested Manhole Diameter (mm) 1200

Control Points	Head (m)	Flow (l/s)
Design Point (Calculated)	0.800	3.5
Flush-Flo™	0.238	3.5
Kick-Flo®	0.521	2.9
Mean Flow over Head Range	-	3.0

The hydrological calculations have been based on the Head/Discharge relationship for the Hydro-Brake® Optimum as specified. Should another type of control device other than a Hydro-Brake Optimum® be utilised then these storage routing calculations will be invalidated

Depth (m)	Flow (l/s)	Depth (m)	Flow (l/s)	Depth (m)	Flow (l/s)	Depth (m)	Flow (l/s)
