

## Plan on Cored Holes in DBM Layer

Scale 1:20

The DBM layer acts as a protection layer during construction. Prior to the installation of the permeable blocks, the DBM should be cored through with 75mm holes on a 750mm orthogonal grid and filled by laying course material immediately prior to laying the block paving, converting the DBM to permeable pavement.

## Gravel Paving Grid (Driveways) Loading Category (Cars & Light Vans)

Design CBR 3% (TBC) Scale 1:20

Gravel Paving Notes:

- 1. Maximum sub-base particle size should match minimum sub-base thickness but not exceed 75mm diameter.
- 2. Maximum advised gradient for traffic applications: 12% (1:8) 7°. BodPave<sup>®</sup>85 has specific pegging points if required for steep slope applications. Pegging is not necessary for standard access route applications.
- 3. The selected gravel fill & bedding should be clean, free-draining, angular shaped material in the specified size range. 4. BodPave<sup>®</sup>85 complies with BS8300:2009 - "Design of buildings and their
- approaches to meet the needs of disabled people" Code of Practice. (ISBN 978 0 580 57419).
- 5. To be read in conjunction with Terram Bodpave installation guide for Gravel

Permeable Block Paving with 6mm joints filled with 2-6mm -Aggregate block colour to architects specification. Lightly compacted and repeat process after 3-4 months to allow for settlement

50mm well compacted permeable bedding layer course type 2/6.3, in accordance with BS EN 13242.2002, BS 7533-13 Table A.2 and Clause 6.7 page 18.

130mm DBM Layer. The DBM should be a 0/32mm size dense base as defined in Section 5.2 of BS4987-1:2005. Installed in accordance with BS4987-2:2003. DBM to be punched or cored with 75mm diameter holes on a 750mm orthogonal grid prior to installation of blocks. Holes filled with 2-6mm Aggregate.

250m 4-20 coarse graded aggregate, in accordance with BS EN -13242.2002, BS 7533-13 Table A.1 & A.3 and Clause 6.2 Page 16. To be consolidated in accordance with MCHW Volume 1 clause 802, table 8/4.

1mm HDPE or PP liner with 300g fleece protection to each side

225mm 6F1 or 6F2. In the case of 6F2 fill materials, it may be necessary to blind the surface with fine aggregate to protect the overlying impermeable geomembrane

Permeable Block Paving with DBM Layer Loading Cateory E (1.5msa) Design CBR 3% (TBC) Scale 1:20

Permeable Block Paving Notes:

- Installation to be in accordance with Interpave "Design & Constuction of Concrete Block Permeable Paving" 2. Advice to be sought from the paving block manufacturer on the exact laying and sub-base grading/ material suitable for their system.
- 3. The sub-base aggregate shall comply with the requirements of BS 7533 -13:2009 Pavements constructed with Clay, natural stone or concrete pavers - Guide for the design of permeable pavements constructed with concrete paving blocks and flags, natural stone slabs and setts and clay pavers, as follows:-3.1. The aggregate shall be a crushed Type 4/20 (4 mm minimum and 20 mm maximum particle size) 3.2. The voids ratio of the sub-base aggregate shall be at least 30%.
- 3.3. Aggregate Particle Shape: Preferably a hard crushed rock. The aggregate must have sufficient internal stability to perform both during installation and in the long term. 3.4. Physical properties shall comply with BS EN 13242: 2002 – Aggregates for unbound and hydraulically
- bound materials for use in civil engineering work and road construction. 4. The laying course and jointing aggregate shall comply with the requirements of a material of type 2/6.3 Gc 80/20 according to BS EN 13242: 2002. 'Aggregates for unbound and hydraulically bound materials for use in
- civil engineering works and road construction' Where a permeable pavement is required to carry site or construction traffic prior to completion, consideration 5. must be given to avoiding contamination of the sub-base. Measures should be taken to avoid this such as:
- 5.1. Consider the construction process during design and identify areas and routes for construction traffic that avoid the permeable sub-base areas.
- 5.2. Where this is not possible, construct the sub-base and then cover it with a sacrificial layer of geotextile and hardcore (100mm thick). This to be removed prior to the installation of the surface course.
