Environmental Desk Study

162 Peterborough Road Whittlesey PE7 1PD

For

Optimum Land and Property Ltd

This report may not be published in any form including uploading to any website without our prior written permission

Our Ref: 16337

June 2023

Prior Associates is the trading name of Prior Associates (Soham) Ltd, registered in England, No. 10284146. A list of directors may be seen at our Soham Offices. Our Conditions of Appointment apply, copies of which may be obtained from our Soham offices No document produced by this Practice may be published in any form including uploading to any website without our written permission.

SUMMARY

We were instructed by the site owner, Mr Robinson of Optimum Land and Property Ltd, to carry out an Environmental Desk Study on a site known as 162 Peterborough Road, Whittlesey. The site was once a petroleum retailer and car repairer. It is currently used for the sale of second hand cars and the storage/sale of house clearance goods.

This report, the Environmental Desk Study, has been prepared following the methodology of the EA guidance document LCRM: Stage 1 risk assessment. It combines a walkover survey of the site in its current form with a desk study of available information about current and former uses of the site and surrounding areas. The underlying geology is examined by the desk study.

It is proposed to erect detached houses with private gardens.

The purpose of this report is to prepare a conceptual site model for the site. A conceptual model represents the characteristics of the site and shows the possible relationships between contaminants, pathways and receptors. If all three are present then there is the possibility of a pollution linkage, whereby the contaminant travels along a pathway to a receptor such as workers developing the site, end users of the site and water sources.

The following sources of potential contamination were identified during the walkover survey.

SOURCE	CONTAMINANT	LOCATION
Servicing of vehicles	Metals, TPH, PAH,	Throughout site
_	Asbestos	-
Fuel Tanks	TPH	As indicated by covers.
		The investigation needs to
		go at least a metre deeper
		than the base of the tanks.

The review of the historic maps, contemporary environmental records and trade entries suggest that the following should be considered.

SOURCE	CONTAMINENT	LOCATION
Landfill in 250-500	Methane Carbon Dioxide	Anywhere on site
metres of site		

Applying this method to the potential pollution linkages determined in the conceptual model results in the table in section 11.2, the risk is moderate and as such an intrusive investigation is required.

Based on the evidence as set out in this report 12 No locations for samples of soil from the proposed garden areas should be submitted to an appropriate testing facility and analysed for CLEA Metals, asbestos fibres, PAH and TPH. Samples should be obtained by window sampling prior to clearance. The sample from 0.3 metres below ground should be tested first and if any concern the sample at 1 metre should be analysed. Samples for TPH should be tested at 0.5m intervals to 1m below the underside of the below ground storage tanks.

Gas monitoring at 5 No locations should be for 6 months initially at 2 monthly intervals.

1 INSTRUCTIONS

1.1 We were instructed by the site owner, Mr Robinson of Optimum Land and Property Ltd, to carry out an Environmental Desk Study on a site known as 162 Peterborough Road, Whittlesey. The site was once a petroleum retailer and car repairer. It is currently used for the sale of second hand cars and the storage/sale of house clearance goods.

2 INTRODUCTION

- 2.1 This report, the Environmental Desk Study, has been prepared following the methodology of the EA guidance document LCRM: Stage 1 risk assessment. It combines a walkover survey of the site in its current form with a desk study of available information about current and former uses of the site and surrounding areas. The underlying geology is examined by the desk study.
- 2.2 The following sources of information have been studied for this report:
 - Historic Ordnance Survey maps of the site
 - Historic photography provided by Google Earth
 - BGS Geological and Radon maps of the area
 - Nature England maps of SSSI and Nature Reserves
 - EA aquifer maps and flood maps for both fluvial and surface water
 - Local Authority Strategic Flood Risk Assessment
 - EA and Local Authority landfill and waste processing databases
 - Contemporary Trade Directories
- 2.3 It is proposed to erect detached houses with private gardens.
- 2.4 All work on this project has been carried out in accordance with our Conditions of Appointment, copies of which are attached for information as Appendix A.
- 2.5 The report was prepared by Gerry Cutting, a Fellow of Institution of Civil Engineers with considerable experience of contaminated land clearance.

3 AIMS OF REPORT

- 3.1 The purpose of this report is to prepare a conceptual site model for the site. A conceptual model represents the characteristics of the site and shows the possible relationships between contaminants, pathways and receptors. If all three are present then there is the possibility of a pollution linkage, whereby the contaminant travels along a pathway to a receptor such as workers developing the site, end users of the site and water sources.
- 3.2 A further aim is to qualify the environmental risks indicated by the conceptual site model and make recommendations for intrusive investigation if deemed necessary.

4 SITE DESCRIPTION, WALKOVER SURVEY AND INFORMATION HELD ON PRIOR ASSOCIATES FILES

- 4.1 The site is approximately rectangular on plan with the main Peterborough Road running east west to form the south boundary.
- 4.2 Whittlesey is a medium sized town just east of Peterborough. It is known for the large, now mostly inactive, clay pits and brick making yards.
- 4.3 A walkover survey was undertaken on the 6th June 2023. The results as recorded that day are attached as Appendix B.
- 4.4 Visually the site appears to rise slightly from the south to the north high, but no check measurements were taken.
- 4.5 Beyond the boundary to the north and east is recent detached houses with private gardens.
- 4.6 Most of the buildings on the site appear now to be used for the storage of house clearance goods and for the sale of some of the arising materials and furniture, whilst the office, a rectangular flat roofed building close to the pump island, is used as an office for the car sales.
- 4.7 We were told by the owner of the house clearance business that the buildings to the west boundary and those to the rear of the Sales Offices were, historically, used for the repair and maintenance of vehicles. There were no pits visible, and we were told there were none, but we could not confirm this as considerable amounts of stored furniture were present masking our view of the floor slab.
- 4.8 We can confirm that some level of servicing was carried out as there was still odd pieces of equipment as would be used to maintain cars.
- 4.9 The main southern part of the site has a concrete surface area, whilst that to the north is gravel finish. As far as could be seen the slabs to the service areas were free of staining from spillages.
- 4.10 In several areas the site could be described as untidy with odd tyres, part worn, laying around together with the occasional drum that once contained lubricant. Despite the untidiness, we did not see any staining from spillage. Pasted below are photographs illustrating the current site condition.

- 4.11 Where there are pitched roofs to the buildings these are covered in fibre cement sheeting and probably contained asbestos.
- 4.12 Part of the buildings to the west boundary had tiled floors and again the tiles may contain asbestos.
- 4.13 A full asbestos survey should be completed before work is started. Work includes demolition. With appropriate controls during demolition there should be no reason for asbestos fibres to be released even if present.
- 4.14 We were told there was no gas service to the property, but electricity is supplied underground, as we assume would be the water service.
- 4.15 There was no vegetation of any significance on the site, but just to the west was what appeared a former 'Christmas tree'. To the north was a relatively large Buddleia. There were no grassed areas.
- 4.16 To the south of the main road were a row of large trees.
- 4.17 Several places on the site contained underground tanks previously used for the storage of petrol and diesel. We were told and we were given certificates, attached as Appendix C, that the tanks had been made safe. Tanks were located at the eastern and western end of the site.
- 4.18 We hold no historic information on this site on our files.
- 4.19 The following sources of potential contamination were identified during the walkover survey.

SOURCE	CONTAMINANT	LOCATION
Servicing of vehicles	Metals, TPH, PAH,	Throughout site
	Asbestos	
Fuel Tanks	TPH	As indicated by covers.
		The investigation needs
		to go at least a metre
		deeper than the base of
		the tanks.

5 SURFACE WATER AND HYDROGEOLOGY

- 5.1 The nearest surface water feature is some 110m southeast of the site.
- 5.2 The Environment Agency monitored rivers for water quality. However, the last monitoring was undertaken in the year 2000; this is considered to be insufficiently recent to be of relevance.
- 5.3 A review of the Environment Agency's flood map indicates that the site is in Flood Zone 1 i.e. it is at least susceptible to flooding.
- 5.4 The BGS ground water flooding susceptibility assessment indicates that the site is unlikely to be at risk from ground water flooding, as from their guidance notes the site has a limited potential for such.
- 5.5 The nearest water extraction point is in excess of 800 metres from the site.
- 5.6 The site lies over a superficial aquifer, designated as a secondary aquifer.

6 ENVIRONMENTAL SENSITIVITY AREAS

- 6.1 The site is in a Nitrate vulnerable zone, as is much of East Anglia.
- 6.2 There are sites of special scientific interest and special areas of conservation in excess of 500 metres from the site.

7 LANDFILL SITE & WASTE MANAGEMENT FACILITIES

- 7.1 The Envirocheck search suggests that there is landfill on the site itself. There is no evidence of the site having been previously excavated from the historic maps.
- 7.2 Within the range 250 500 metres from the site is potentially infilled land and a registered landfill site.
- 7.3 The registered landfill site is limited to waste produced on site.

SOURCE	CONTAMINANT	LOCATION
Landfill in 250-500	Methane, Carbon	Anywhere on site
metres of site	Dioxide	_

8 RADON

8.1 The Landmark report states that the consideration of radon potential on this site is not applicable. This is because within the one kilometre square containing this site less than 1% of the homes are at or above the action level hence no action is needed.

9 SITE HISTORY

- 9.1 A review of historic maps dating back to the late Nineteenth Century has been undertaken. Copies of the historic maps are included as Appendix D.
- 9.2 The historical development of the site and its environs, as shown by these maps, is summarised below:

Period	Description	Potential Contaminants
1887	The site is shown as open, presumably agricultural land to the north of the Peterborough Road. No features local to the site are shown.	None
1926	No features are changed on the site but to the south, some 100 metres distant, excavations are shown, presumably for the obtaining of clay to make bricks.	None
1973	The fuel station is shown. Residential accommodation has been built as road frontage and to the rear of the site is a set of nurseries.	See para 4.18
1976	The nurseries are reduced in size and the pit to the south beyond Peterborough Road is labelled as disused.	None
1986	Mobile greenhouses are shown on the land to the north of the site. No other features local to the site have changed.	None
1994	No significant changes but a tank is labelled to the east of the site.	None
1997 1:10000	The pit is shown extending as far as the Peterborough Road, i.e. within in approximately 50 metres of the site.	See para 7.3

- 9.3 The nearest trade entries are shown on the site itself as Aster Cars, car dealers active and K B Motors Garage Services active. We believe the latter is incorrect and it is has now ceased trading.
- 9.4 Within 25 metres of the site is Davy Transport Services, sand gravel and other aggregates labelled inactive. J M Transport Ltd, road haulage services are active at 156 metres from the site. These are unlikely to generate any contaminants other than those listed in Paragraph 4.15.
- 9.5 The review of the historic maps, contemporary environmental information and trade entries suggest that the following should be considered.

SOURCE	CONTAMINENT	LOCATION
Landfill in 250-500	Methane, Carbon Dioxide	Anywhere on site
metres of site		

10 CONCEPTUAL SITE MODEL

10.1 The conceptual site model requires the identification of three elements:

- a **Source**, defined in LCRM as "*a contaminant or pollutant that is in, on or under the land and that has the potential to cause harm or pollution*".
- a **Pathway**, defined in LCRM as "*a route by which a receptor is or could be affected by a contaminant*".
- a **Receptor**, defined in LCRM as "something that could be adversely affected by a contaminant, for example a person, controlled waters, an organism, an ecosystem, or Part 2A receptors such as buildings, crops or animals".
- 10.2 All three elements must be present to form an S-P-R linkage for a site or partial area of a site to be considered contaminated.
- 10.3 Potential Contamination Sources:

From review of the historic maps and existing environmental information relating to the site, the following <u>potential</u> sources of contamination have been identified:

Potential Source	Potential Contaminants
On site	
Retail and storage	TPH
of road fuels	
Vehicle repair TPH, PAH, metals, asbestos fibre	
Roof sheeting	Asbestos fibre
Off site	
Adjacent landfill	Carbon Dioxide, Methane

10.4 Potential Receptors:

The possible receptors are listed in the table below, together with their potential relevance to any contamination present at the site.

	Potential Receptor	Relevant
1.	Construction workers involved in the development	Yes
2.	Occupiers of the site post-development	Yes
3.	Off-site residents and workers	Yes
4.	Main rivers	No
5.	Off-network watercourses	No
6.	Shallow groundwater local to the site	Yes
7.	Aquifers beneath the site	Yes

10.5 Potential Pathways:

The guidance in LCRM notes that pathways will be specific to the receptor type. The following pathways have been considered relevant to at least one of the foregoing receptors depending on the contaminant type under consideration. For example, ingestion routes are relevant to human receptors, whereas leachate migration would only directly affect groundwater receptors. The relevance of each pathway to this site is noted in the table if applicable.

	Potential Pathway	Relevant
1.	Outdoor ingestion of soil	Yes
2.	Indoor ingestion of soil dust	Yes
3.	Consumption of homegrown vegetables	Yes
4.	Ingestion of soil attached to homegrown vegetables	Yes
5.	Skin contact with outdoor soil	Yes
6.	Skin contact with indoor dust	Yes
7.	Outdoor inhalation of fugitive dust	Yes
8.	Indoor inhalation of dust	Yes
9.	Outdoor inhalation of soil vapour	Yes
10.	Indoor inhalation of soil vapour	Yes
11.	Gas evolving from contaminants	Yes
12.	Contaminants travelling through ground to water	Yes
13.	Contaminant leachates travelling through ground to water	Yes

10.6 In summary the Conceptual Site model for the site is:

Contaminants	Pathways	Receptors
Metals, PAH	1, 2, 3, 4, 5, 6, 7, 8, 11, 12, 13	1, 2, 3, 6, 7
TPH	5, 9, 10, 11, 12	1, 2, 3, 6, 7
Carbon	9, 10, 11	1, 2
Dioxide,		
Methane		
Asbestos	7, 8	1, 2, 3

11 PRELIMINARY RISK ASSESSMENT

- 11.1 In preparing the preliminary risk assessment, we have been guided by CIRIA publication C552 "Contaminated land risk assessment: A Guide to Good Practice". This determines the overall risk in relation to the consequence of a risk occurring and the probability of that risk occurring. A summary of the category of probability and consequences of a risk, together with the classification matrix and definition of the resulting classifications is included as Appendix E.
- 11.2 Applying this method to the potential pollution linkages determined in the conceptual model results in the table overleaf, the risk is moderate.

Potential Source	Possible Pathway	Possible receptor	Probability	Consequence	Risk	Comment
Carbon Dioxide, Methane, evolving from off-site Landfill	9, 10, 11	1, 2	Low likelihood	Severe	Moderate	Lateral migration of gases in shallow permeable superficial soils would be limited. Small risk of fissures in clay alowing gas transmission.
TPH from vehicles in garage and underground storage tanks	5, 9, 10, 11, 12	1, 2, 3, 6, 7	Likely	Medium	Moderate	
Metals and PAH from vehicle repair on site	1,2, 3, 4, 5, 6, 7, 8, 11, 12, 13	1, 2, 3, 6, 7	Likely	Medium	Moderate	
A sbestos fibre from vehicle repair and roof sheeting	9, 10, 11	1, 2, 3	Likely	Medium	Moderate	Risk of fibre release from roof sheeting will be mitigated by appropriate demolition techniques.

12 INTRUSIVE INVESTIGATION

- 12.1 The evidence produced by the desk study and walkover survey of this site shows that there is a Moderate risk of contamination on this site. As such an intrusive investigation should be carried out.
- 12.2 If any signs of contamination, such as odour or staining of the ground are encountered after the initial investigation, professional advice should be sought before proceeding further.
- 12.3 Based on the evidence as set out in this report 12 No locations for samples of soil from the proposed garden areas should be submitted to an appropriate testing facility and analysed for CLEA Metals, PAH and TPH. Samples should be obtained by window sampling prior to clearance. The sample from 0.3 metres below ground should be tested first and if any concern the sample at 1 metre should be analysed. In addition, samples adjacent to the underground storage tanks should be tested at 0.5m intervals to 1m below the underside of the tank for TPH.
- 12.4 Gas monitoring at 5 No locations should be for 6 months initially at 2 monthly intervals.

13 PHASE II

13.1 A Phase II report on the sampling set out in section 12 above should be prepared with the results of the testing compared with the relevant S4UL guidance for the proposed end use of the site.

14 **REMEDIATION**

- 14.1 Remedial works may be required depending on the findings of the Phase II report.
- 14.2 The tanks should be removed, and the sides and base of each excavation tested for TPH. Further remediation may then be required.

15 VALIDATION REPORT

15.1 If remedial works are required a Validation Report should be prepared and submitted. This would need to include a paper trail for the movement of soils on and off site.

16 CONCLUSIONS

16.1 The risk of contamination on this site is Moderate. A Phase II investigation is therefore required utilising both laboratory testing and gas monitoring. This could sensibly be carried out by breaking through hard areas before clearance starts.

Gerry Cutting, BSc, CEng, FICE For and on behalf of Prior Associates

Risk Matrix

	Consequence of	risk being realised	
Classification	Category	Definition	Examples
Severe	Humans	Short-term (acute) risk to health likely to result in <i>"significant harm</i> " as defined by the Environmental Protection Act, Part 2A	High cyanide concentration in soil
acute short- term risks only	Controlled Waters	Short-term risk of pollution of sensitive water resource	Diesel spillage carried by runoff into river
	Property	Catastrophic damage to buildings/property	Methane build-up from ground gas causing explosion
	Ecological System	Short-term risk to a particular ecosystem	Herbicide leak onto meadow
Medium	Humans	Chronic damage to health resulting in " <i>significant harm</i> " as defined in DEFRA Circular 01/2006	Concentration of arsenic in excess of Soil Guideline Values
Chronic risks	Controlled waters	Pollution of sensitive water resources	Lead leaching through soil into aquifer
	Ecological system	A significant change to an ecosystem	Runoff contamination causing death of a plant within a designated nature reserve
Mild	Humans	Permanent effects to human health preventable use of PPE etc.	Asbestos fibres contained within soil
Chronic risks or those involving less sensitive	Controlled Waters	Pollution of non- sensitive water resources	Pollution of non- classified groundwater
receptors	Ecological System	Significant damage to crops or the environment	
Minor Mild chronic long term risks	Humans	Non-permanent health effects to human health preventable by measures such as PPE	Concrete dust during construction

	Probability of Risk Being Realised						
Classification	Definition						
High likelihood	Presence of a pollution linkage and an event that is either <u>very likely</u> in the short term or <u>almost inevitable</u> over the long term, or there is evidence of contamination or harm to the receptor						
Likely	There is a pollution linkage, with all three elements in place which means it is probable						
	that an event will occur. Circumstances are such that it is not inevitable, but possible in						
	the short term and <u>likely</u> in the long term.						
Low Likelihood	A pollution linkage is present and it is possible that an event could occur. However, it is						
	less likely in the short term and possible in the long term						
Unlikely	There is a pollution linkage present, but the circumstances of an event are such that it is						
	improbable to occur, even in the very long term						

	Risk Classification Matrix								
	A	s per CIRIA		Conse	quence				
	C5	552, 2001 p82	Severe	Medium	Milc	Minor			
>	ty	High Likelihood	Very High	High	Moderate	Moderate/Low			
	ilida	Likely	High	Moderate	Moderate/Low	Low			
Probability	Pr oba	Low Likelihood	Moderate	Moderate/Low	Low	Very Low			
		Unlikely	Moderate/Low	Low	Very Low	Very Low			

	Risk Classification Definitions					
Very High There is a high probability that severe harm could arise to a receptor from an identified						
hazard or there is evidence that this is currently happening. Urgent investigation and						
	remediation are likely to be required					
High Harm is likely to arise to a receptor from an identified hazard. Urgent investigation is						
	required and remediation may be necessary in the short term and likely in the long term.					
Moderate It is possible that harm could arise to a receptor from an identified hazard. It is eith						
relatively unlikely that such harm would be severe, or if harm were to occur it i						
	likely that the harm would be relatively mild. Investigation is required to clarify the risk					
	and some remediation may be required in the long term.					
Moderate/Low						
Low	It is possible that harm could arise to a receptor from an identified hazard, but it is likely					
	that any harm arising would at worst normally be mild.					
Very Low	There is a low possibility that harm could arise to a receptor. In the event of such harm					
	being realised it is not likely to be severe.

Introduction

The Environment Act 1995 has made site sensitivity a key issue, as the legislation pays as much attention to the pathways by which contamination could spread, and to the vulnerable targets of contamination, as it does the potential sources of contamination. For this reason, Landmark's Site Sensitivity maps and Datasheet(s) place great emphasis on statutory data provided by the Environment Agency/Natural Resources Wales and the Scottish Environment Protection Agency: it also incorporates data from Natural England (and the Scottish and Welsh equivalents) and Local Authorities; and highlights hydrogeological features required by environmental and geotechnical consultants. It does not include any information concerning past uses of land. The datasheet is produced by querying the Landmark database to a distance defined by the client from a site boundary provided by the Client. In this datasheet the National Grid References (NGRs) are rounded to the nearest 10m in accordance with Landmark's agreements with a number of Data Suppliers.
