Details and style of proposed new flue.

Flueing

What is a flue?

A flue is a pipe, a duct or chimney for removing combustion gases from a boiler. Many different types of flue have been used over the years; however, all modern boilers now use a fanned flue, which can be fitted differently depending on where your boiler is situated:

Horizontal flue:

- ✓ Our most popular, commonly used flue
- ✓ Ideal for a like-for-like boiler swap with little fuss.
